UNLESS OTHERWISE SPECIFIED, THE INFORMATION GIVEN IN THIS MANUAL ARE REFERRED TO ALL MODELS IN PRODUCTION AT THE ISSUE DATE OF THIS DOCUMENT.

GENERAL INSTRUCTIONS

CUSTOM S.p.A. declines all responsibility for accidents or damage to persons or property occurring as a result of tampering, structural or functional modifications, unsuitable or incorrect installations, environments not in keeping with the equipment's protection degree or with the required temperature and humidity conditions, failure to carry out maintenance and periodical inspections and poor repair work.

GENERAL SAFETY INFORMATION

Your attention is drawn to the following actions that could compromise the characteristics of the product:

- Read and retain the instructions which follow.
- Follow all indications and instructions given on the device.
- Make sure that the surface on which the device rests is stable. If it is not, the device could fall, seriously damaging it.
- Make sure that the device rests on a hard (non-padded) surface and that there is sufficient ventilation.
- Do not fix indissolubly the device or its accessories such as power supplies unless specifically provided in this manual.
- When positioning the device, make sure cables do not get damaged.
- [Only OEM equipment] The equipment must be installed in a kiosk or system that provides mechanical, electrical and fire protection.
- The mains power supply must comply with the rules in force in the Country where you intend to install the equipment.
- Make sure that there is an easily-accessible outlet with a capacity of no less than 10A closely to where the device is to be installed.
- Make sure the power cable provided with the appliance, or that you intend to use is suitable with the wall socket available in the system.
- Make sure the electrical system that supplies power to the device is equipped with a ground wire and is protected by a differential switch.
- Before any type of work is done on the machine, disconnect the power supply.
- Use the type of electrical power supply indicated on the device label.
- These devices are intended to be powered by a separately certified power module having an SELV, non-energy hazardous output. (IEC60950-1 second edition).
- [Only POS equipment] The energy to the equipment must be provided by power supply approved by CUSTOM S.p.A.
- Take care the operating temperature range of equipment and its ancillary components.
- Do not block the ventilation openings.
- Do not insert objects inside the device as this could cause short-circuiting or damage components that could jeopardize printer functioning.
- Do not carry out repairs on the device yourself, except for the normal maintenance operations given in the user manual.
- The equipment must be accessible on these components only to trained, authorized personnel.
- Periodically perform scheduled maintenance on the device to avoid dirt build-up that could compromise the correct, safe operation of the unit.
- Do not touch the head heating line with bare hands or metal objects. Do not perform any operation inside the printer immediately after printing because the head and motor tend to become very hot.
- Use consumables approved by CUSTOM S.p.A.

CE THE CE MARK AFFIXED TO THE PRODUCT CERTIFY THAT THE PRODUCT SATISFIES THE BASIC SAFETY REQUIREMENTS.

The device is in conformity with the essential Electromagnetic Compatibility and Electric Safety requirements laid down in Directives 2014/30/EU and 2014/35/EU inasmuch as it was designed in conformity with the provisions laid down in the following Standards:

- EN 55032 *(Limits and methods of measurements of radio disturbance characteristics of Information Technology Equipment)*
- EN 55024 *(Information Technology Equipment – Immunity characteristics – Limits and methods of measurement)*
- EN 60950-1 *(Safety of information equipment including electrical business equipment)*

The device is in conformity with the essential requirements laid down in Directives 2014/53/EU about devices equipped with intentional radiators The Declaration of Conformity and other available certifications can be downloaded from the site www.custom4u.it.

GUIDELINES FOR THE DISPOSAL OF THE PRODUCT

The crossed-out rubbish bin logo means that used electrical and electronic products shall NOT be mixed with unsorted municipal waste. For more detailed information about recycling of this product, refer to the instructions of your country for the disposal of these products.

- Do not dispose of this equipment as miscellaneous solid municipal waste, but arrange to have it collected separately.
- The re-use or correct recycling of the electronic and electrical equipment (EEE) is important in order to protect the environment and the wellbeing of humans.
- In accordance with European Directive WEEE 2002/96/EC, special collection points are available to which to deliver waste electrical and electronic equipment and the equipment can also be handed over to a distributor at the moment of purchasing a new equivalent type.
- The public administration and producers of electrical and electronic equipment are involved in facilitating the processes of the re-use and recovery of waste electrical and electronic equipment through the organisation of collection activities and the use of appropriate planning arrangements.
- Unauthorised disposal of waste electrical and electronic equipment is punishable by law with the appropriate penalties.

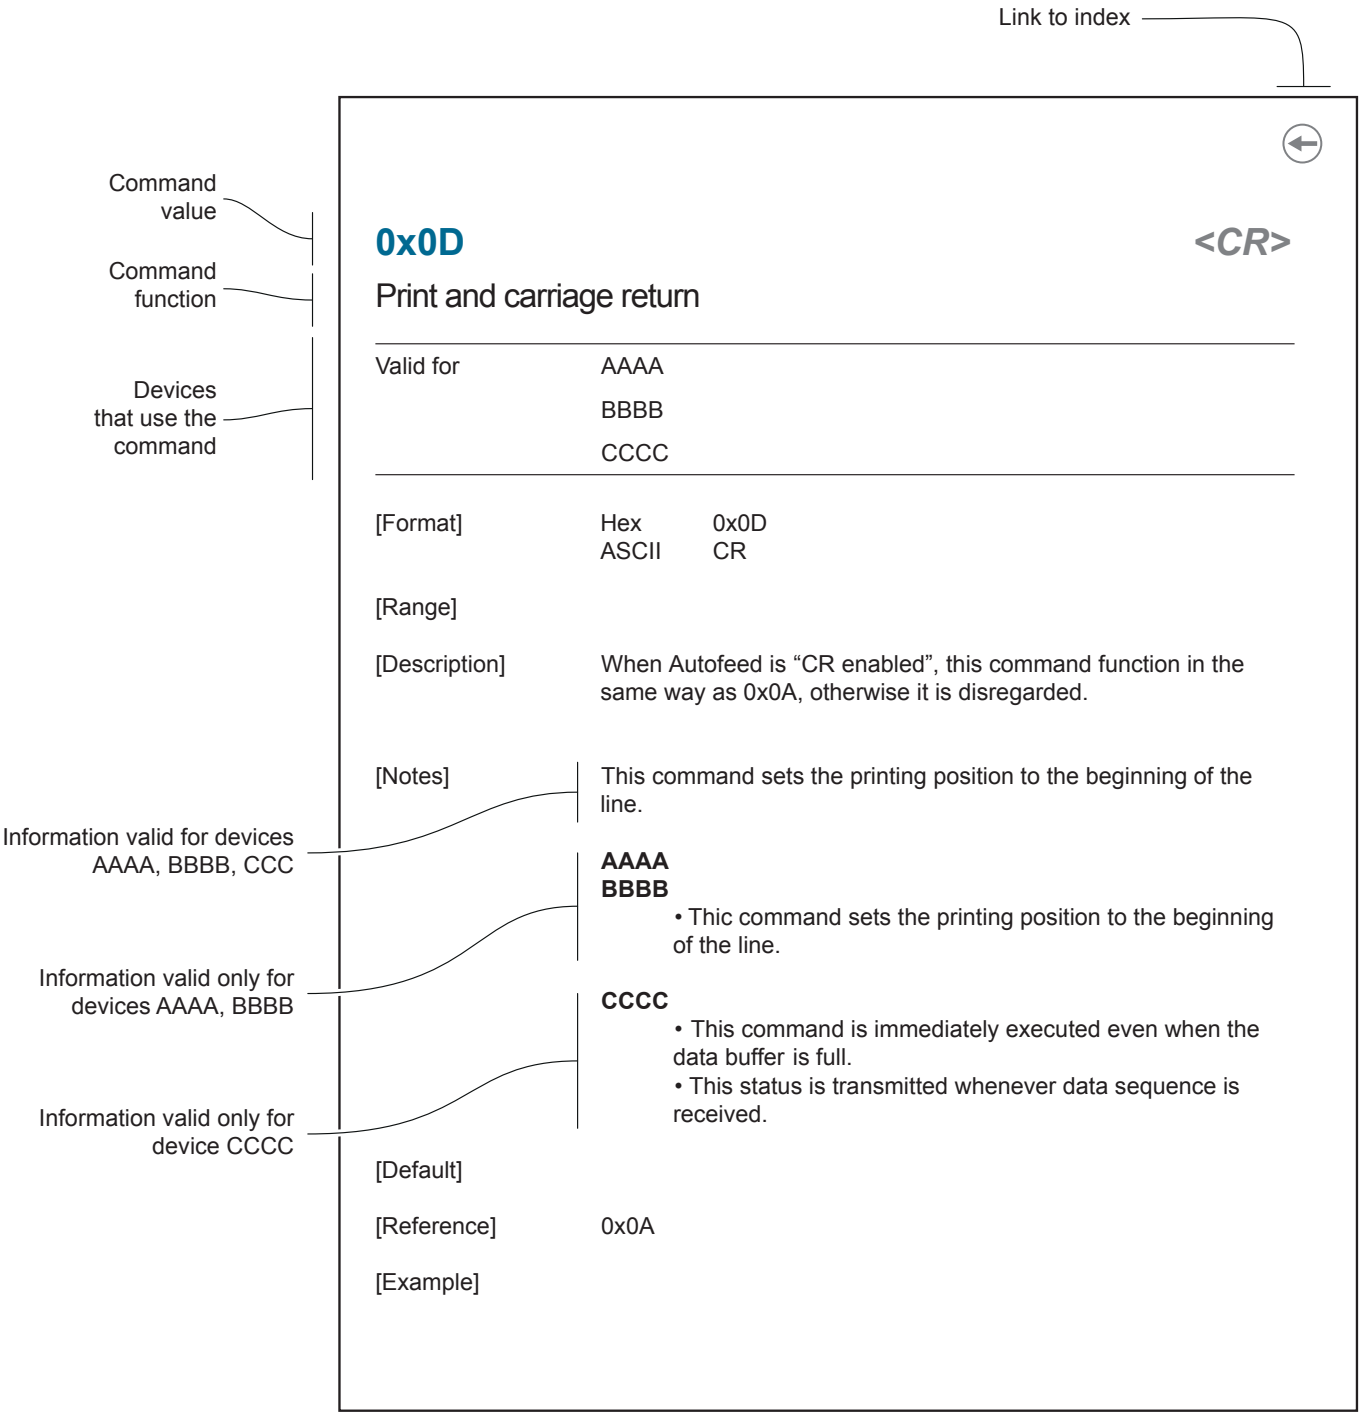
1 CONSULTING COMMANDS MANUAL

Each command reported in this manual is described as shown in the following picture. In the first heading field is reported the hexadecimal command value and the ASCII command value. In the second heading field reported the command function. In the third heading field are listed the devices on which it is possible to use the command (for example, device AAAA).



The fields shown in the scheme of the previous figure have the following meaning:

[Format]	hexadecimal and ASCII command value.
[Range]	Limits of the values the command and its variables can take.
[Description]	Description of command function.
[Notes]	Additional information about command use and settings.
[Default]	Default value of the command and its variables.
[Reference]	Pertaining commands related to described command.
[Example]	Example of using the command.

Listed below are the meanings of some of symbols that may be found in the command description:

0x	indicates the representation of the command hexadecimal value (for example 0x40 means HEX 40).
n, m, t, x, y	are optional parameters that can have different values.

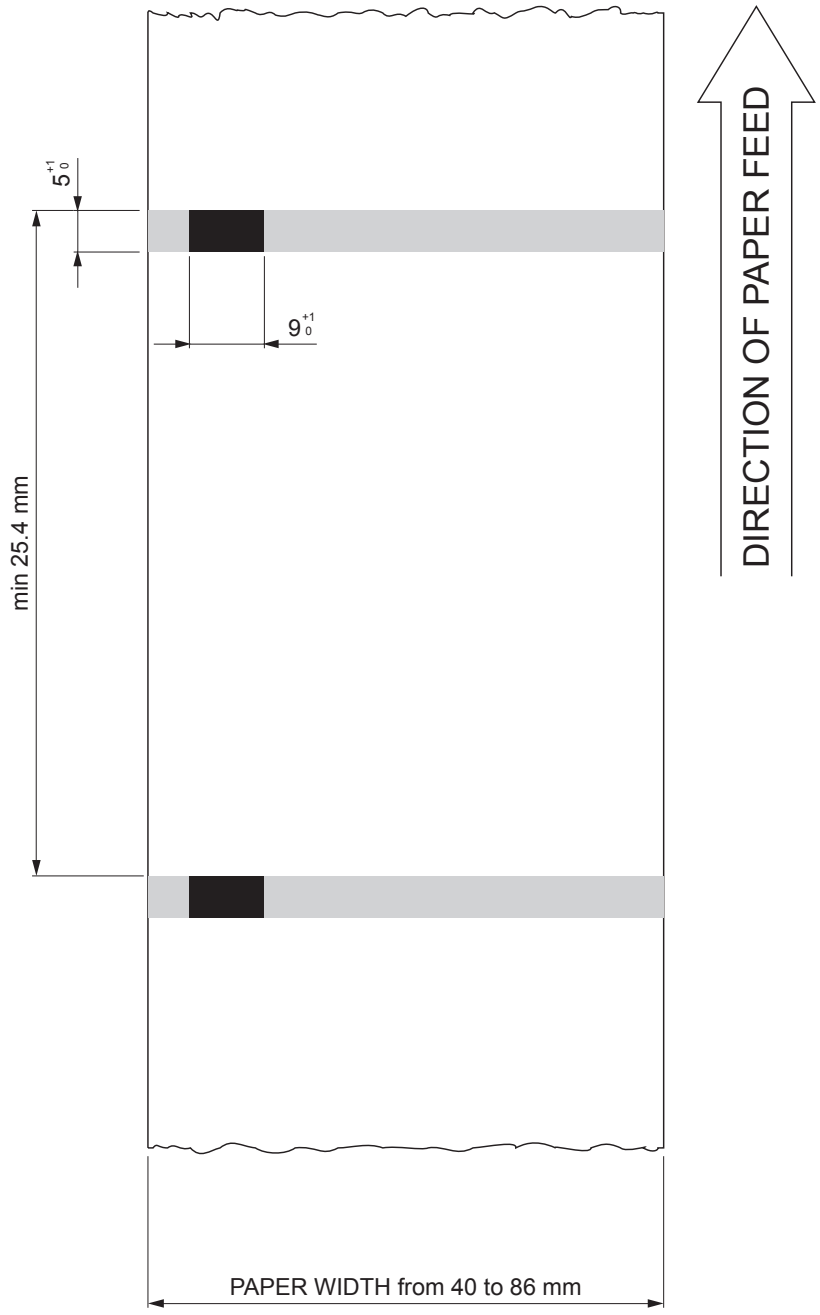
3 PAPER SPECIFICATION

All the dimensions shown in following figures are in millimetres.

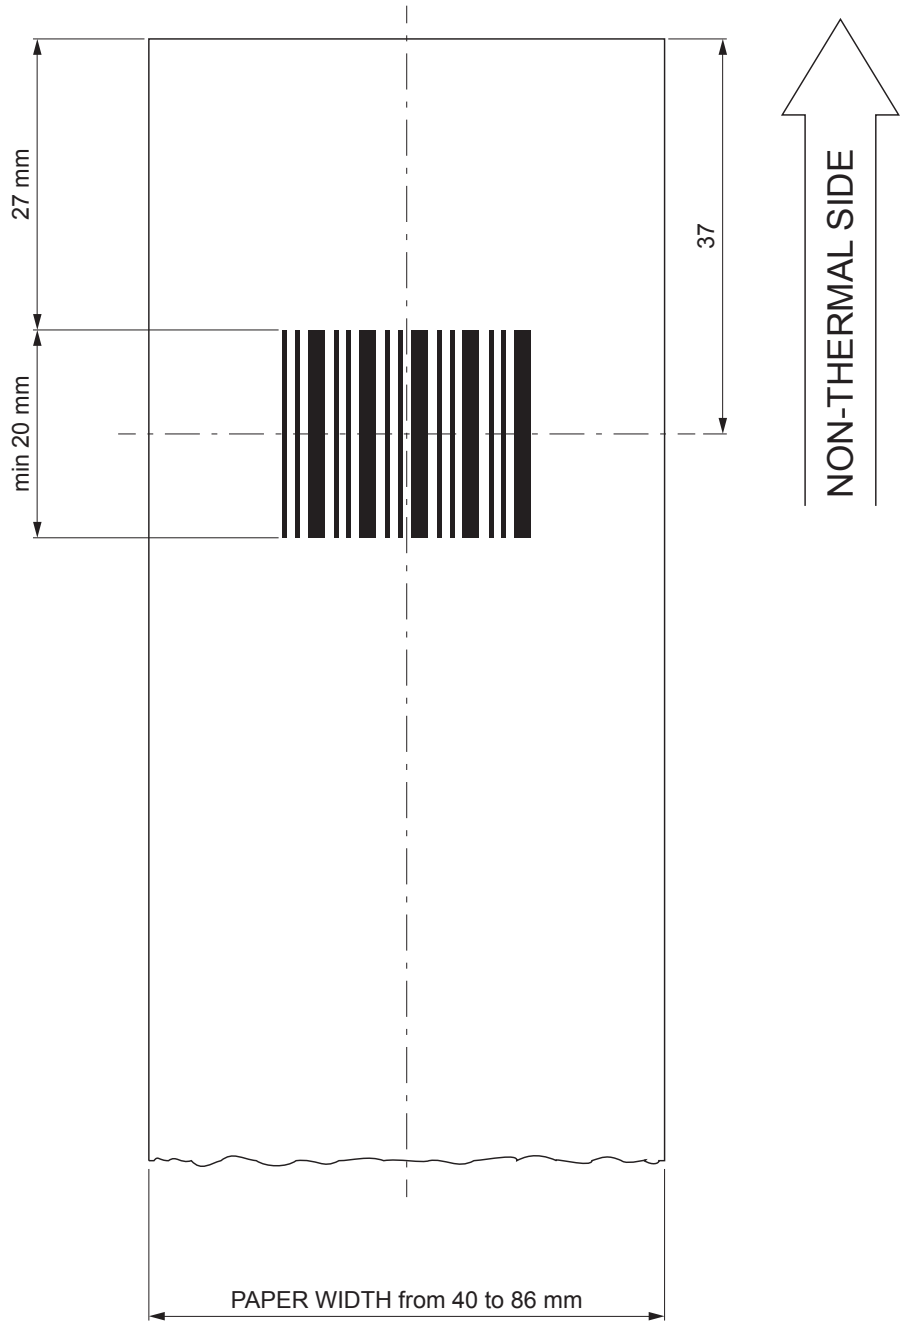
Paper with black mark on the non-thermal side

The following image shows the placement of the black mark on the non-thermal side of the paper. The black mark can be placed anywhere on the whole width of the paper.
For more information about the use of paper with black mark see user manual.



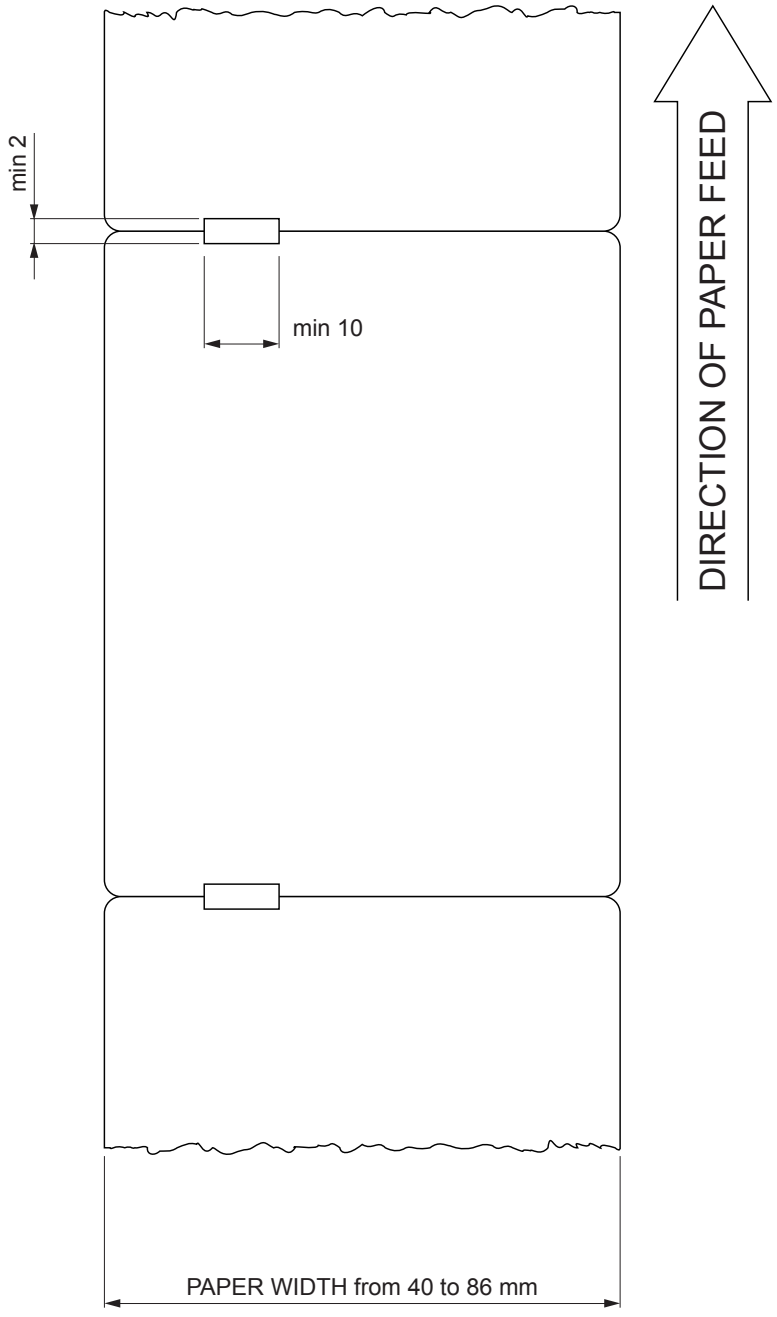
Paper with barcode

The following image shows the placement of the barcode on the ticket. The barcode must be printed on the non-thermal side of the paper and at 27 mm from the edge of the ticket to ensure the correct barcode reading when ticket alignment is performed.
For more information about the use of paper with barcode see user manual.



Fan-fold paper with hole

The following image shows the placement of the hole on the paper. The hole can be positioned across the width of the ticket. To manage tickets with hole, set the parameters “Notch/B.Mark Pos. F1” and “Notch/B.Mark Pos. F2” (for models with dual feeder) to “Transparent”.
For more information about the use of paper with hole see user manual.



Ticket with RFID tag (models with RFID reader/writer)

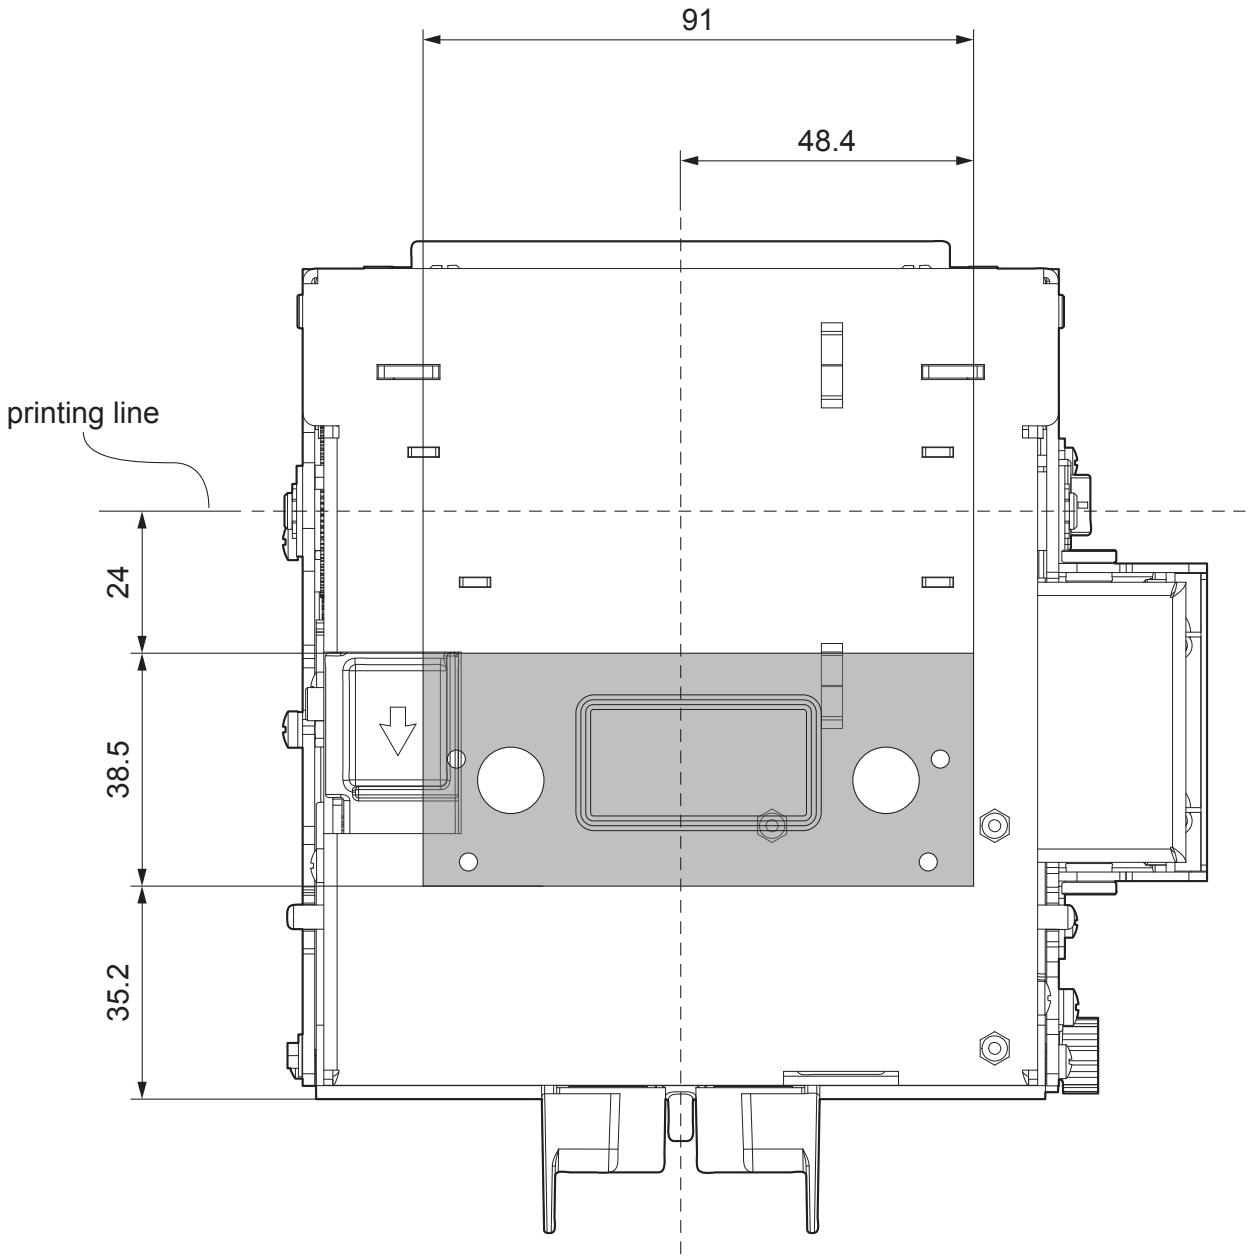
RFID (acronym for Radio Frequency IDentification) is a technology to identify automatically items using radio waves; this system is based on wireless data capture from RFID tag using appropriate readers. The RFID tag, or transponder, is made up of :

- the microchip that stores the data (including also a unique serial number written);
- an RFID antenna.

The device models are equipped with an RFID transceiver, provided with antenna, that allows to send and receive RF data to and from the tag. For this application the ticket dimensions are not binding but for good reading is important that the tag inside the ticket, after alignment, intersects the antenna area.

The following figure shows the available position of antenna RFID inside the device.

HF RFID module



NOTE: For ease of reference, for some models is represented only the standard model of internal printer group without dual feeder.

[Range] 0x00 ≤ n ≤ 0x03

[Description] Enables the debugging function of the lower scanner and allows to create the image of a scanned barcode based on the value of n as follows:

BIT	OFF/ON	n	FUNCTION
0	-	0x00	Debugging disabled
1	Off	0x00	Disable image creation
	On	0x01	Enable image creation
2	Off	0x00	Disable overlapping data creation
	On	0x02	Enable overlapping data creation

[Notes] If command is successful the device transmits the ACK (0x06), otherwise returns NACK (0x015).

[Range]

[Description] Transmit the value of the barcode read from the VeriPrint® scannner.

[Notes]
- If the barcode is found, the device returns:
  1st byte: ACK (0x06)
  2nd byte: number of barcode HRI characters
  from the 3rd byte: barcode HRI characters
- If the barcode is not found, the device returns NACK (0x15).
- This command is active only if the additional barcode reading function has been enabled.

[Description]

Set barcode reasearch filter in the scanned image and research timeout.

• The parameter n specifies which scanner is used as follows:

n	SCANNER USED
0x00	Upper scanner
0x01	Lower scanner

• b1...b4 consists of 4 bytes which compose the barcode search filter as follows:

1st byte

BIT	OFF/ON	HEX	BARCODE

• The parameter t consists of the 2 bytes tH and tL and specifies the timeout, expressed in ms, of the barcode search..

[Notes]

• This command works only in RAM memory.
• The 2 bytes of the t parameter compose an single value that goes from 0 to 1000 ms even if the minimum value is forced to 100 ms.
• This command is active only if the additional barcode reading function has been enabled.

[Range]

[Description] Transmits the barcode found from the lower scanner in the search area specified by the command 0x1F 0x52.

- If the barcode is found, the device returns:
  1st byte: ACK (0x06)
  2nd byte: number of barcode HRI characters
  from the 3rd byte: barcode HRI characters

- If the barcode is not found, the device returns NACK (0x15).

Transmit the size of an image file of the latest VeriPrint® scan

Valid for	KPM862 VR, TK862 VR			
[Format]	Hex	1F	6F	FF
	ASCII	US	o	0xFF
[Range]				
[Description]	Transmits the size of an image file of the latest VeriPrint® scan.			
[Notes]	• The device transmits the size of an image file in 4 bytes. • The return order is inverted. The lowest value is the first received. • This command is active only if the additional barcode reading function has been enabled.			
[Default]				
[Reference]	0x1F 0x4F 0xFF			
[Example]	If the size of an image is 1000 bytes, the device returns 0xE8 0x03 0x00 0x00 instead of 0x00 0x00 0x03 0xE8.

m = 0x30 0x30 ≤ n ≤ 0x38
m = 0x31 0x01 ≤ n ≤ 0x28

[Description]

Specifies the error correction level of PDF417 barcode. This error correction allows the barcode to endure some damage without causing loss of data. The error correction level depends on the amount of data that needs to be encoded, the size and the amount of symbol damage that could occur.
• pL and pH specify the number of successive bytes to be sent.
• The error correction level is specified by “level” when m = 0x30.
• The error correction level is specified by “ratio” when m = 0x31 [n × 10%].

[Notes]

• Error correction level is specified by either “level” or “ratio”.
• Error correction level specified by “level” (m = 0x30) is as follows. The number of the error correction code word is fixed regardless of the number of code words on the data area.

n	CORRECTION LEVEL	N. OF ERROR CORRECTION CODE WORD
0x30	Error correction level 0	2
0x31	Error correction level 1	4
0x32	Error correction level 2	8
0x33	Error correction level 3	16
0x34	Error correction level 4	32
0x35	Error correction level 5	64
0x36	Error correction level 6	128
0x37	Error correction level 7	256
0x38	Error correction level 8	512

• Error correction level specified by “ratio” (m = 0x31) is as follows. The error correction level is defined by the calculated value [number of data code word × n × 0.1 = (A)]. The number of the error correction code word is changeable in proportion to the number of the code words on the data area.

CALCULATED VALUE (A)	CORRECTION LEVEL	N. OF ERROR CORRECTION CODE WORD
0 - 3	Error correction level 1	4
4 - 10	Error correction level 2	8
11 - 20	Error correction level 3	16
21 - 45	Error correction level 4	32
46 - 100	Error correction level 5	64
101 - 200	Error correction level 6	128
201 - 400	Error correction level 7	256
> 400	Error correction level 8	512

Settings are effective until 0x1B 0x40 is executed or the device is reset or turned off.

[Default] m = 0x31, n = 0x01 [ratio: 10%]

[Reference] 0x1D 0x28 0x6B

[Example] To set error correction = 0.2, the command sequence is:

[Description]

Stores the data (d1...dk) in the barcode save area for printing in PDF417 format.

• pL and pH specify the number of successive bytes to be sent.

• k bytes of d1...dk are processed as barcode data.

[Notes]

• Data stored in the barcode save area by this function are processed by Function 081 and then reserved.

• Specify only the data code word of the barcode with this function. Be sure not to include the control data in the data d1...dk because they are added automatically by the device.

• Settings are effective until 0x1B 0x40 is executed or the device is reset or turned off.

[Description] Encodes the data in the barcode save area and prints it in PDF417 format.
• pL and pH specify the number of successive bytes to be sent.

[Notes]
• In standard mode, use this function when device is at the beginning of a line or there is no data in the print buffer.
• A barcode that size exceeds the printing area cannot be printed.
• If there is any error described below in the data of the barcode save area, it cannot be printed.
  - There is no data (Function 080 is not processed).
  - If [(number of columns × number of rows) < number of code word] when auto processing is specified for number of columns and number of rows.
  - Number of code word exceeds 928 in the data area.
• When auto processing (Function 065) is specified, the number of columns is calculated by the current printing area, module width (Function 067) and the code word in the data area. Maximum number of the columns is 30.

[Description] Transmits the QRcode barcode size in the barcode save area.

[Notes]

• To store the data in the device barcode save area use the Function 180.
• In standard mode, use this function when device is at the beginning of a line or when there is no data in the print buffer.
• pL and pH specify the number of successive bytes to be sent.
• The size information for each data is as follows:

SEND DATA	HEX	DATA
Header	37	1 byte
Identifier	36	1 byte
Horizontal size (1)	30-39	1 - 5 byte
Separator	1F	1 byte
Vertical size (1)	30-39	1 - 5 byte

(1) “Horizontal size” and “vertical size” indicate the number of dots of the symbol.
The values of the vertical size and horizontal size are converted to characters and sent starting from the high order end (ex: When horizontal size is 120 dots, horizontal size is 0x31 0x32 0x30, which is 3 bytes of data).
(2) ”Other information” indicates whether printing of the data in the symbol storage area is possible or impossible. The “Other information“ is the following:

HEX	CONDITION
30	Printing is possible
31	Printing is impossible

• Size information indicates size of symbol that is printed by Function 181.
• The quiet zone is not included in the size information.
• If “other information” is “Printing is impossible“(0x31), use one of the solutions shown below:

[Range] (pL+pH × 256) = 3 (pL = 0x03, pH = 0x00)

[Description] Encodes the data in the barcode save area and prints it in two-dimensional GS1 Databar format.

[Notes]

• Data stored in the barcode save area are processed by Function 380.
• In standard mode, use this function when printer is “at the beginning of a line” or “there is no data in the print buffer”.
• pL and pH specify the number of successive bytes to be sent.
• A barcode that size exceeds the printing area cannot be printed.
• If there is any error described below in the data of the barcode save area, it cannot be printed.
  - There is no data (Function 380 is not processed).
  - When there is a problem with the amount of data saved in the barcode save area.
  - When the data saved in the barcode save area includes data outside the domain.
• Printing of symbol is not affected by print mode (emphasized, double-strike, underline, white/ black reverse printing, or 90° clockwise-rotated), except for character size and upside-down print mode.
• In standard mode, this command executes paper feeding for the amount needed for printing the symbol, regardless of the paper feed amount set by the paper feed setting command. The print position returns to the left side of the printable area after printing the symbol, and printer is in the status “beginning of the line,” or “there is no data in the print buffer.
• In page mode, the printer stores the symbol data in the print buffer without executing actual printing. The printer moves print position to the next dot of the last data of the symbol.
• The quiet zone is not included in the printing data. Be sure to include the quiet zone when using this function.
• Applied to GS1 Databar Stacked and GS1 Databar Stacked Omnidirectional. The data shown below is added automatically in encoding:
  - Application identifier (AI): The AI is ‘01’;
  - Check digit (1 character);
  - Guard pattern and separator pattern.
• Applied to GS1 Databar Expanded Stacked. The data shown below is added automatically in encoding:
  - Guard pattern, finder pattern and separator pattern;
• For encoding, the width of the symbol is decided by the setting value of Function 371 of this command (nL + nH x 256) and the current printing area.
  - When (nL + nH = 256) = 0x00, the width of the symbol is the current printing area.
  - When (nL + nH 256) is not 0x00 is specified and the setting value is greater than the current printing area, the width of the symbol is the current printing area.
  - In cases other than above, (nL + nH x 256) is the width of the symbol.

[Description] Specifies encoding type of AZTEC barcode based on the value of n as follows:

n	ENCODING
0x00	FULL AZTEC
0x01	AZTEC RUNE

[Notes]
- Full Aztec: Encode all extended ASCII characters data up to a maximum length of approximately 3832 numeric or 3067 alphabetic characters or 1914 bytes of data.
- pL and pH specify the number of successive bytes to be sent.
- “AZTEC RUNE” is a compact Aztec Code, sometimes called “SMALL AZTEC CODE”. Encode all numbers from 0 to 255 up to a maximum length of 3 numbers.

[Default] n = 0x00

[Range] 0x01 ≤ n ≤ 0xFF

[Description] Sets the height of the 1D barcode.
n specifies the number of vertical dots.

[Notes]

[Default] n = 0xA2 (20.25 mm)

[Reference] 0x1D 0x6B

[Example] To print a barcode with height of 15 mm, the command sequence is:
0x1D 0x68 0x78

Where:
15 mm = 15 × 8 dots = 120 dots which converted in hexadecimal value = 0x78

[Notes]

• If d is outside of the specified range, the device prints the following message: “BARCODE GENERATOR IS NOT OK!” and processes the data which follows as normal data.
• If the horizontal size exceeds the printing area, the device only feeds the paper.
• This command feeds as much paper as is required to print the barcode, regardless of the line spacing specified by 0x1B 0x32 or 0x1B 0x33.
• After printing the barcode, this command sets the print position to the beginning of the line.
• This command is not affected by print modes (bold, double-strike, underline or character size), except for upside-down and justification mode.

Format 1

• This command ends with a NUL code.
• When the barcode system used is UPC-A or UPC-E, the device prints the barcode data after receiving 11 (without check digit) or 12 (with check digit) bytes barcode data.
• When the barcode system used is EAN13, the device prints the barcode data after receiving 12 (without check digit) or 13 (with check digit) bytes barcode data.

• When the barcode system used is EAN8, the device prints the barcode data after receiving 7 (without check digit) or 8 (with check digit) bytes barcode data.
• The number of data for ITF barcode must be even numbers. When an odd number of data is input, the device ignores the last received data.

Format 2

If n is outside of the specified range, the device stops command processing and processes the following data as normal data.
When CODE93 is used:
• The device prints an HRI character (o) as a start character at the beginning of the HRI character string.
• The device prints an HRI character (o) as a stop character at the end of the HRI character string.
• The device prints an HRI character (n) as a control character (0x00 to 0x1F and 0x7F).

When CODE128 is used, please note the following regarding data transmission:
• The top part of the barcode data string must be a code set selection character (CODE A, CODE B or CODE C) which selects the first code set.
• Special characters are defined by combining two characters “{“ and one character. ASCII character “{” is defined by transmitting “{“ twice, consecutively.

SPECIFIC CHARACTER	DATA TRANSMISSION	
	ASCII	HEX
SHIFT	{S	7B, 53
CODE A	{A	7B, 41
CODE B	{B	7B, 42
CODE C	{C	7B, 43
FNC1	{1	7B, 31
FNC2	{2	7B, 32
FNC3	{3	7B, 33
FNC4	{4	7B, 34
‘{‘	{{	7B, 7B

When UPC-E is used, introducing the barcode characters, the device prints:

[Format]

Hex	1B	20	n
ASCII	ESC	SP	n

[Range] 0x00 ≤ n ≤ 0xFF

[Description] Sets the character spacing for the right side of the character to [n × horizontal or vertical motion units].

[Notes]

- The right character spacing for double-width mode is twice the normal value. When the characters are enlarged, the right side character spacing is m (2 or 4) times the normal value.
- The horizontal and vertical motion units are specified by 0x1D 0x50. Changing the horizontal or vertical motion units does not affect the current right side spacing.
- The 0x1D 0x50 command can change the horizontal (and vertical) motion unit. However, the value cannot be less than the minimum horizontal movement amount.
- The maximum right side spacing is 32 mm.
- In standard mode, the horizontal motion unit is used.

[Notes]

- The device can underline all characters, but cannot underline the spaces set by 0x09, 0x1B 0x24, 0x1B 0x5C and 90°/270° rotated characters.
- This command resets the left and right margin at default value (see 0x1D 0x4C, 0x1D 0x57).
- 0x1B 0x45 can also be used to turn the bold mode on or off. However, the last-received setting command is the effective one.
- 0x1B 0x2D can also be used to turn the underlining mode on or off. However, the last-received setting command is the effective one.
- 0x1D 0x21 can also be used to select character height or width. However, the last-received setting command is the effective one.
- 0x1B 0x34 can also be used to turn the italic mode on or off. However, the last-received setting command is the effective one.

• Commands that change the height and width of characters are effective on the x and y axes. In case of 90°/270° rotated characters, command 0x1B 0x21 0x10 selects double-width mode and command 0x1B 0x21 0x20 selects double-height mode.

0x00 ≤ x ≤ 0x08 (font 8 x 24)
0x00 ≤ d0…dk ≤ 0xFF
k = cn – c1 + 1

[Description]

Defines user programmable characters.
y specifies the number of bytes in the vertical direction.
c1 specifies the start character code and cn specifies the final character code of the characters map area.
x specifies the width of the character to be replaced.
d0...dk specifies the new character definition.

[Notes]

• It is possible to define multiple characters for consecutive character codes.
If only one character is desired, use c1 = cn.
• if cn < c1, the command is not executed.
• d is the dot data for the characters. The dot pattern is in the horizontal direction starting from the left. Any remaining dots on the right remain blank.
• The data to define a user-defined character is (x × y) bytes.
• To print a dot, set the corresponding bit to 1; to not have it print, set to 0.
• This command can define different user-defined character patterns for each font. To select the font, use 0x1B 0x21.
• The user programmable character definitions are cleared when commands 0x1B 0x40, 0x1D 0x2A or 0x1B 0x3F are executed or the device is reset or turned off.
• x1 [d0 ... dk] will be repeated for each character to be replaced.

Turn bold mode on or off

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format]

Hex	1B	45	n
ASCII	ESC	E	n

[Range] 0x00 ≤ n ≤ 0xFF

[Description] Turns bold mode on or off, based on the n value:
- when the Least Significant Bit (LSB) of n is 0, the bold mode is off.
- when the Least Significant Bit (LSB) of n is 1, the bold mode is on.

[Notes]
• Only the Least Significant Bit (LSB) of n is effective.
• 0x1B 0x21 also turns on and off the bold mode. However, the last received command is the effective one.

[Default] n = 0x00

[Range] 0x00 ≤ n ≤ 0xFF

[Description] Turns double-strike mode on or off, based on the n value:
- when the Least Significant Bit (LSB) of n is 0, the double-strike mode is off.
- when the Least Significant Bit (LSB) of n is 1, the double-strike mode is on.

[Notes]
• Only the Least Significant Bit (LSB) of n is effective.
• Device output is the same in double-strike and bold mode.

[Range] 0x00 ≤ n ≤ 0xFF

[Description] Turns upside-down printing mode on or off, based on the value of n:
- when the Least Significant Bit (LSB) of n is 0, the upside-down printing mode is off.
- when the Least Significant Bit (LSB) of n is 1, the upside-down printing mode is on.

[Notes]
- Only the Least Significant Bit (LSB) of n is effective.
- This command is valid only if entered at the beginning of a line.
- In upside-down printing mode, the device rotates the line to be printed 180° and then prints it.

[Range] 0x00 ≤ n ≤ 0x02

[Description] Select the font type based on the value of n as follows:

n	FONT TYPE
0x00	International
0x01	Chinese GB18030
0x02	Korean PC949

[Notes]
- This command can be used only for the models with Extended Chinese font (GB18030) or Korean font (PC949).
- The selection made by this command is stored in the RAM memory. Turning off the device reverts to the default value, that can be set with the “Font type” parameter during the setup procedure (refer to the user manual of the device).
- After selecting the font type “International” it must be selected the desired character code table using the command 0x1B 0x74.

[Default] n = 0x00

0x40 ≤ n ≤ 0x47	0x50 ≤ n ≤ 0x57
0x60 ≤ n ≤ 0x67	0x70 ≤ n ≤ 0x77

[Description]

Selects character height and width, as follows:
- Bits 0 to 3: to select character height (see table 2).
- Bits 4 to 7: to select character width (see table 1).

Table 1 Select character width

HEX	WIDTH
00	1 (normal)
10	2 (width = 2x)
20	3 (width = 3x)
30	4 (width = 4x)
40	5 (width = 5x)
50	6 (width = 6x)
60	7 (width = 7x)
70	8 (width = 8x)

Table 2 Select character height

HEX	HEIGHT
00	1 (normal)
01	2 (height = 2x)
02	3 (height = 3x)
03	4 (height = 4x)
04	5 (height = 5x)
05	6 (height = 6x)
06	7 (height = 7x)
07	8 (height = 8x)

[Notes]

- This command is effective for all characters (except HRI characters).
- If n falls outside the defined range, this command is ignored.
- Characters enlarged to different heights on the same line are aligned at the baseline or top line.
- 0x1B 0x21 can also be used to select character size. However, the setting of the last received command is the effective one.
- This command is effective on the x and y axes. In case of 90°/270° rotated characters, bit from 0 to 3 select character width and bit from 4 to 7 select character height.

[Default]

n = 0x00

Turn black and white reverse printing mode on or off

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format]

Hex	1D	42	n
ASCII	GS	B	n

[Range] 0x00 ≤ n ≤ 0xFF

[Description] Turns black and white reverse printing mode on or off, based on the value of n:
- when the Least Significant Bit (LSB) of n is 0, white/black reverse printing is turned off.
- when the Least Significant Bit (LSB) of n is 1, white/black reverse printing is turned on.

[Notes]
• Only the Least Significant Bit (LSB) di n is effective.
• This command is available for both built-in and user-defined characters.
• This command does not affect bit image, downloaded bit image, barcode, HRI characters and spacing skipped by 0x09, 0x1B 0x24 and 0x1B 0x5C.
• This command does not affect white space between lines.
• White/black reverse mode has a higher priority than underline mode. Even if underline mode is on, it will be disabled (but not cancelled) when black and white reverse mode is selected.

n	ENCODING
0x00, 0x30	Disabled
0x01, 0x31	Enable UTF-8
0x02, 0x32	Enable UTF-16

[Notes]

• This command is valid only for TrueType fonts of monospace type.
• If the text encoding is disabled, manage the characters coding by 0x1B 0x52 and 0x1B 0x74 commands.
• If the text encoding is enabled, the character's addressing respects the UNICODE standard (see www.unicode.org).

ASCII	FS	f	m	n	d[0]...d[n]

[Range]

0 ≤ m ≤ 0xFF
0 ≤ n ≤ 0x40

[Description]

Manage the TrueType fonts based on the value of m as follows:

m (BIT)	FUNCTION
0	Check glyph width
1	TTF enable hinting
2	Not used
3	Not used
4	Re-enable TrueType font
5	Disable TrueType font
6	De-init TrueType font
7	Clear all

n = name length of the font to use
d[0]...d[n] = font name to use

[Notes]

• If “Check glyph width” is selected, for every character, device checks if the glyph width is different from default width. In this case, the font will be not installed. The check may require some time (it depends on the characters number of the font).
• For “Hinting” means the font adaptation to the grid. Whit hinting enabled, the characters are more legible but some characters may be too high (for example, the accented capital letters). This bit is active only when you install a new font.
• “Re-enable” function re-enables a TrueType font previously disabled.
• “Disable” function disables a TrueType font.
• “De-init” function uninstall a font and clear the memory used by the font. Use this function only when you intend to use the font more, otherwise use the “Disable” function to speed up operations.
• “Clear all” function uninstall all the installed fonts.
• If command is successful the device transmits the ACK (0x06), otherwise return NACK (0x15).
• After “Disable”, “Re-enable” and “Clear-all” functions, do not pass the filename of the TrueType font.

[Format]										
	Hex	1D	E9	dimFile	2C	43	2C	fd0..fdn	2C	d0..dn
	ASCII	GS	0xE9	dimFile	,	C	,	fd0..fdn	,	d0..dn

[Range] 0x00 ≤ dimFile ≤ 0xFF
0x00 ≤ d0, dn ≤ 0xFF

[Description] Saves the font received from serial port into the device flash.
- dimFile indicates the file size (4 bytes expressed in hexadecimal notation)
- fd0..fdn indicates the font-name
- d0..dn indicates the bytes of the entire “font.ttf” fyle

[Notes]
- The length fd0..fdn of the font-name can be up to 50 characters long.
- The maximum file size is related to the free space in the flash.
- The font-name specified in this command does not depend on the file-name because it is uniquely assigned in flash; therefore the font into the flash will be named as specified.
- If command is successful the device transmits ACK (0x06), otherwise transmits NACK (0x15).

Default]

[Example] To load the TrueType font “ARIAL.ttf”, send the command:
0x1D 0xE9 0x00 0x0B 0xE1 0x38 0x2C 0x43 0x2C “ARIAL.ttf” 0x2C *“file.ttf”*

where the sequence 0x00 0x0B 0xE1 0x38 indicates the file size (778552 byte).

[Format]

Hex	1D	EA	43
ASCII	GS	0xEA	C

[Range]

[Description] This command requests to the device the list of stored TrueType fonts into the device flash. The device returns a bytes sequence as follows:

“filename.ttf”, “filename2.ttf”, “filename3.ttf”, “filename4.ttf” 0x06

where ACK (0x06) character indicates that the command is successful, otherwise return NACK (0x15).

[Notes]

Default]

[Reference] 0x1D 0xE9

[Example] To request the list of stored TrueType fonts the command sequence is:
0x1D 0xEA 0x43

If two fonts “Vera” and “Veramono” are stored in flash memory, the response of the device will be:
“Vera.ttf”, ”Veramono.ttf” 0x06

[Range] 0x00 ≤ d0, dn ≤ 0xFF

[Description] Deletes the TrueType font specified from the device flash.
• fd0..fdn indicates the font-name

[Notes]
• The length fd0..fdn of the font-name can be up to 50 characters long.
• If command is successful the device transmits the ACK (0x06), otherwise return NACK (0x015).
• The ‘ * ’ character is the terminator character of this command (in ASCII).

[Format]

Hex	1B	57	xL	xH	yL	yH	dxL	dxH	dyL	dyH
ASCII	ESC	W	xL	xH	yL	yH	dxL	dxH	dyL	dyH

[Range] 0x00 ≤ xL, xH, yL, yH, dxL, dxH, dyL, dyH ≤ 0xFF (except dxL= dxH = 0x00 or dyL = dyH = 0x00)

[Description] The horizontal starting position, vertical starting position, printing area width, and printing area height are defined as x0, y0, dx (inch), dy (inch), respectively.
Each setting for the printing area is calculated as follows:
x0 = [(xL + xH × 256) × (horizontal motion unit)]
y0 = [(yL + yH × 256) × (vertical motion unit)]
dx = [(dxL + dxH × 256) × (horizontal motion unit)]
dy = [(dyL + dyH × 256) × (vertical motion unit)]

[Notes]
- If this command is input in standard mode, the device executes only internal flag operation. This command does not affect printing in standard mode.
- If the horizontal or vertical starting position is set outside the printable area, the device stops command processing and processes the following data as normal data.
- If the printing area width or height is set to 0, the device stops command processing and processes the following data as normal data.
- If (horizontal starting position + printing area width) exceeds the printable area, the printing area width is automatically set to (horizontal printable area -horizontal starting position).
- If (vertical starting position + printing area height) exceeds the printable area, the printing area height is automatically set to (vertical printable area - vertical starting position).
- The horizontal and vertical motion unit are specified by 0x1D 0x50. Changing the horizontal or vertical motion unit does not affect the current printing area.
- The 0x1D 0x50 command can change the horizontal (and vertical) motion unit. However, the value cannot be less than the minimum horizontal movement amount, and it must be in even units of minimum horizontal movement amount.
- Use the horizontal motion unit (x) for setting the horizontal starting position and printing area width, and use the vertical motion unit (y) for setting the vertical starting position and printing area height.
- When the horizontal starting position, vertical starting position, printing area width, and printing area height are defined as X, Y, Dx, and Dy respectively, the printing area is set.

Set absolute vertical print position in page mode

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format]

Hex	1D	24	nL	nH
ASCII	GS	$	nL	nH

[Range] 0x00 ≤ nL, nH ≤ 255, 0 ≤ nH ≤ 0xFF

[Description] This command sets the absolute vertical print starting position for buffer character data in page mode to [(nL + nH × 256) × (vertical or horizontal motion unit)].

[Notes]

- This command is effective only in page mode.
- If the [(nL + nH × 256) × (vertical or horizontal motion unit)] exceeds the specified printing area, this command is ignored.
- The horizontal starting buffer position does not move.
- The reference starting position is that specified by 0x1B 0x54.
- This command operates as follows, depending on the starting position of the printing area specified by 0x1B 0x54:

1) When the starting position is set to the upper left or lower right, this command sets the absolute position in the vertical direction.
2) When the starting position is set to the upper right or lower left, this command sets the absolute position in the horizontal direction.

- The horizontal and vertical motion unit are specified by 0x1D 0x50.
- The 0x1D 0x50 command can change the horizontal and vertical motion unit. However, the value cannot be less than the minimum horizontal movement amount, and it must be in even units of the minimum horizontal movement amount.

[Format]

Hex	1D	5C	nL	nH
ASCII	GS	\	nL	nH

[Range] 0x00 ≤ nL, nH ≤ 0xFF

[Description] This command sets the relative vertical print starting position from the current position in page mode to [(nL + nH × 256) × vertical or horizontal motion unit].

[Notes]

- This command is ignored unless page mode is selected.
- When N is specified to the movement downward: nL + nH × 256 = N
- When N is specified to the movement upward: nL + nH x 256 = 65536 - N
- Any setting that exceeds the specified printing area is ignored.
- This command function as follows, depending on the print starting position set by 0x1B 0x54:

1) When the starting position is set to the upper left or lower right of the printing, the vertical motion unit (y) is used.
2) When the starting position is set to the upper right or lower left of the printing area, the horizontal motion unit (x) is used.

- The horizontal and vertical motion unit are specified by 0x1D 0x50.
- The 0x1D 0x50 command can change the horizontal (and vertical) motion unit. However, the value cannot be less than the minimum horizontal movement amount, and it must be in even units of the minimum horizontal movement amount.

[Format]

Hex	1D	E1
ASCII	GS	0xE1

[Range]

[Description] Reading of length paper available before virtual paper-end (expressed in centimetres).
The command return a string pointing out how much paper is available.

[Notes]
- The length of residual paper reported is just as an indication because tolerances and other factors are not taken into consideration (paper thickness, roll core diameter, roll core thickness).
- The virtual paper-end limit is set by the command 0x1D 0xE6.
- To set virtual paper-end limit, measure the length of the paper from low paper to the end of the roll, using several of them.

0x00 ≤ nL ≤ 0xFF
0x00 ≤ nH ≤ 0x03
0x00 ≤ d ≤ 0xFF

[Description]

Selects a bit image mode using m for the number of dots specified by nL and nH, as follows:

m	MODE	VERTICAL DIRECTION		HORIZONTAL DIRECTION	
		N. DOTS	DPI	DPI	N. DATA (k)
0x00	8 dots single density	8	67	100	nL + nH × 256
0x01	8 dots double density	8	67	200	nL + nH × 256
0x20	24 dots single density	24	200	100	(nL + nH × 256) × 3
0x21	24 dots double density	24	200	200	(nL + nH × 256) × 3

[Notes]

• The nL and nH commands indicate the number of dots of the bit image in the horizontal direction. The number of dots is calculated using: nL + nH × 256.
• If the bit image data input exceeds the number of dots to be printed on a line, the excess data is ignored.
• d indicates the bit image data. Set a corresponding bit to 1 to print a dot, or to 0 to not print the dot.
• If the value of m is outside the specified range, nL and data following it are processed as normal data.
• If the width of the printing area set by 0x1D 0x4C and 0x1D 0x57 is less than the width required by the data set using 0x1B 0x2A, the excess data are ignored.
• To print the bit image use 0x0A, 0x0D, 0x1B 0x4A or 0x1B 0x64.
• After printing a bit image, the device returns to normal data processing mode.
• This command is not affected by the bold, double-strike, underline (etc.) print modes, except for the upside-down mode.

• The relationship between the image data and the dots to be printed is as follows:

ASCII	FS	p	n	m

[Range]

0x01 ≤ n ≤ 0xFF
0x00 ≤ m ≤ 0x03
0x30 ≤ m ≤ 0x33

[Description]

Prints a NV bit image n using the mode specified by m:

m	MODE
0x00, 0x30	Normal
0x01, 0x31	Double width
0x02, 0x32	Double heigth
0x03, 0x33	Quadruple

• n is the number of the NV bit image

[Notes]

• NV bit image means a bit image which is defined in a non-volatile memory by 0x1C 0x71 and printed by 0x1C 0x70.
• This command is not effective when the specified NV bit image has not been defined.
• In standard mode, this command is effective only when there is no data in the print buffer.
• This command is not affected by print modes (bold, underline, character size, white/black reverse printing, etc.), except upside-down printing mode.
• If the printing area width set by 0x1D 0x4C and 0x1D 0x57 for the NV bit image is less than one vertical line, the following processing is executed only on the line in question. However, in NV bit image mode, one vertical line means 1 dot (one half dot for slip paper) in normal mode (m = 0x00, 0x30) and in double-height mode (m = 0x02, 0x32), and it means 2 dots (two half dots for slip paper) in double-width mode (m = 0x01, 0x31) and in quadruple mode (m = 0x03, 0x33).
• The printing area width is extended to the right in NV bit image mode up to one line vertically. In this case, printing does not exceed the printable area.
• If the printing area width cannot be extended by one line vertically, the left margin is reduced to accommodate one line vertically.
• If the downloaded bit image to be printed exceeds one line, the excess data is not printed.
• This command feeds dots (for the height n of the NV bit image) in normal and double-width modes, and (for the height n x 2 of the VN bit image) in double-height and quadruple modes, regardless of the line spacing specified by 0x1B 0x32 or 0x1B 0x33.
• After printing the bit image, this command sets the print position to the beginning of the line and processes the data that follows as normal data.
• In page mode, this command is effective only if m = 0x00 or 0x30.

0x00 ≤ yL ≤ 0x01 (when 1 ≤ (yL + yH × 256) ≤ 288
0x00 ≤ d ≤ 0xFF
k = (xL + xH × 256) × (yL + yH × 256) × 8
Total defined data area = 3 MB

[Description]

Define the NV bit image specified by n.
• n specifies the number of the defined NV bit image.
• xL, xH specifies (xL + xH × 256) × 8 dots in the horizontal direction for the NV bit image you are defining.
• yL, yH specifies (yL + yH × 256) × 8 dots in the vertical direction for the NV bit image you are defining.

[Notes]

• Frequent write command execution may cause damage the NV memory. Therefore, it is recommended to write the least possible in the memory and no more then 10 times per day.
• This command cancels all NV bit images that have already been defined by this command. The device can not redefine only one of several data definitions previously defined. In this case, all data needs to be sent again.
• NV bit image means a bit image which is defined in a non-volatile memory by 0x1C 0x71 and printed by 0x1C 0x70.
• In page mode, this command is not effective.
• When the amount of data exceeds the capacity left in the range defined by xL, xH, yL, yH, the device processes xL, xH, yL, yH out of the defined range.
• In the first group of NV bit images, when any of the parameters xL, xH, yL, yH is out of the definition range, this command is disabled.
• In groups of NV bit images other than the first one, when the device processes xL, xH, yL, yH out of the defined range, it stops processing this command and starts writing into the non-volatile images. At this time, NV bit images that haven't been defined are disabled (undefined), but any NV bit images before that are enabled.
• The d indicates the definition data. In data (d) a 1 bit specifies a dot to be printed and a 0 bit specifies a dot not to be printed.
• This command defines n as the number of a NV bit image. Numbers rise in order from NV bit image 01H. Therefore, the first data group [xL xH yL yH d1...dk] is NV bit image 01H, and the last data group [xL xH yL yH d1...dk] is NV bit image n. The total agrees with the number of NV bit images specified by command 0x1C 0x70.
• A definition data of a NV bit image consists of [xL xH yL yH d1...dk]. Thefore, when only one NV bit

image is defined, n = 0x01.
• The device processes a data group [xL xH yL yH d1...dk] once.
• The device uses ([data: (xL + xH × 256) × (yL + yH × 256) × 8] + [header :4]) bytes of non-volatile memory.
• The definition area in this device is a maximum of 3 MB. This command can define several NV bit images, but cannot define a bit image data whose total capacity [bit image data + header] exceeds 3 MB.
• When this command is received during macro definition, the device ends macro definition, and begins executing this command.
• Once a NV bit image is defined, it is not erased by executing 0x1B 0x40, reset, and power off.
• This command executes only definition of a NV bit image and does not execute printing. Printing of the NV bit image is executed by the 0x1C 0x70 command.

0x00, 0x30	Normal
0x01, 0x31	Double width
0x02, 0x32	Double height
0x03, 0x33	Quadruple

• xL, xH selects the number of data bytes (xL + xH × 256) in the horizontal direction for the bit image.
• yL, yH selects the number of data bytes (yL + yH × 256) in the vertical direction for the bit image.
• k shows the number of data of the image. It's an explanation parameter so it isn't necessary to transmit it.
• d shows the data of the image.

[Notes]

• In standard mode for receipt paper, this command is effective only when there is no data in the print buffer.
• The data (d) identify as 1 a printed bit and as 0 a non printed bit.
• If a raster bit image is longer than one line, the surplus data aren't printed.
• This command has no effect in all print modes (character size, bold, upside-down, underline, white/black reverse printing, etc.) for raster bit image, except the reverse mode (90° anticlockwise rotation).

[Description]
Sets horizontal tab positions
• n specifies the column number for setting a horizontal tab position calculated from the beginning of the line.
• k indicates the total number of horizontal tab positions to be set.

[Notes]
• The horizontal tab position is stored as a value of [character width × n] measured from the beginning of the line. The character width includes the right-side character spacing and double-width characters are set with twice the width of normal characters.
• This command cancels previous tab settings.
• Up to 32 tab positions (k = 0x20) can be set. Data exceeding 32 tab positions is processed as normal data.
• Send [n] k in ascending order and place a 0 NUL code at the end. When [n] k is less than or equal to the preceding value [n] k-1, the setting is complete and the data which follows is processed as normal data.
• 0x1B 0x44 0x00 cancels all horizontal tab positions.
• The previously specified horizontal tab position does not change, even if the character width is modified.

[Default]
Default tab positions are set at intervals of 8 characters (columns 9, 17, 25, …) when the right-side character spacing is 0.

[Description]

Sets the print starting position based on the current position by using the horizontal or vertical motion unit.
Sets the distance from the current position to [(nL+ nH × 256) × horizontal or vertical motion unit].

[Notes]

- When the starting position is specified by N motion units to the right: nL + nH × 256 = N.
- When the starting position is specified by n motion units to the left (negative direction), use the complement of 65536: nL + nH × 256 = 65536 – N.

- In standard mode, the horizontal motion unit is used.
- It's possible to print further on the right margin set for every font. In this case the printing continues up to the maximum border of the device mechanism and then begins a new row.

[Description]

This command selects the type of justification based on the value of n as follows:

n	JUSTIFICATION
0x00, 0x30	Left justification
0x01, 0x31	Centered
0x02, 0x32	Right justification

[Notes]

• Lines are justified within the specified printing area.
• Spaces set by 0x09, 0x1B 0x24 and 0x1B 0x5C will be justified according to the previously-entered mode.

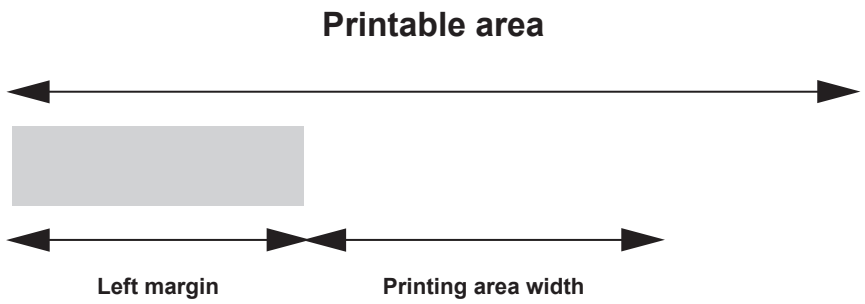
[Range] 0x00 ≤ nL, nH ≤ 0xFF

[Description] Sets the left margin to [(nL + nH × 256) × horizontal motion unit].



[Notes]
- If the setting exceeds the printable area, the maximum value of the printable area is used.
- If the left margin + printing area width is greater than the printable area, the printing area width is set at maximum value.
- The horizontal and vertical motion unit are specified by 0x1D 0x50. Changing the horizontal or vertical motion unit does not affect the current left margin.

[Description] Starts or ends macro definition.

[Notes]

- Macro definition starts when this command is received during normal operation.
- When 0x1D 0x5E is received during macro definition, the device ends macro definition and clears all definitions.
- Macros are not defined when power is turned on to the machine.
- Macro content is not cancelled by the 0x1B 0x40 command. Therefore, 0x1B 0x40 may be included in the content of macro definitions.
- If the device receives 0x1D 0x3A a second time after previously receiving 0x1D 0x3A, the device remains in macro undefined status.
- The contents of the macro can be defined up to 1024 bytes. If the macro definition exceeds 1024 bytes, excess data is not stored.

Hex	1D	5E	r	t	m
ASCII	GS	^	r	t	m

[Range]

0x00 ≤ r, t ≤ 0xFF
0x00 ≤ m ≤ 0x01

[Description]

Executes a macro.
• r specifies the number of times to execute the macro.
• t specifies the waiting time for executing the macro.
The waiting time is t × 100 ms for each macro execution.
• m specifies macro executing mode:
When the Least Significant Bit (LSB) of m = 0, the macro is executed r times continuously at the interval specified by t.
When the Least Significant Bit (LSB) of m = 1, after waiting for the period specified by t, the LED indicator blinks and the device waits for the FEED button to be pressed. After the button is pressed, the device executes the macro once. The device repeats the operation r times.

[Notes]

• This command has an interval of (t × 100 ms) after a macro is executed by t.
• If this command is received while a macro is being defined, the macro definition is aborted and the definition is cleared.
• If the macro is not defined or if r is 0x00, nothing is executed.
• When the macro is executed by pressing the FEED button (m = 0x01), the paper cannot be fed using the FEED button.

[Format]

Hex	1D	E7	nL	nH
ASCII	GS	0xE7	nL	nH

[Range]

0x00 ≤ nH ≤ 0xFF
0x00 ≤ nL ≤ 0xFF

[Description]

Sets black mark distance in tenth of millimeter of the alignment point from the edge of the black mark. This value is expressed as [(nH × 256) + nL] where:
- if nH ≤ 0x7F , the value will be positive.
- if nH > 0x7F , the value will be negative.

[Notes]

• The maximum value is 99.8 mm.
• The minimum value is -99.8 mm.
• The distance is saved in nonvolatile memory: it is therefore recommended not to send this command for each printed ticket, because the number of rewrites is limited. In many devices, however, is checked the diversity of the data before performing the rescue to avoid reaching the limit of rewrites.
• The distance defined by this command is the same that can be set with the value of the “Cut Distance” during the setup of the device or by modifying the same parameter of the “Setup.ini” file (see user manual for further explanation).

[Default]

nH = 0x00
nL = 0x00

[Reference]

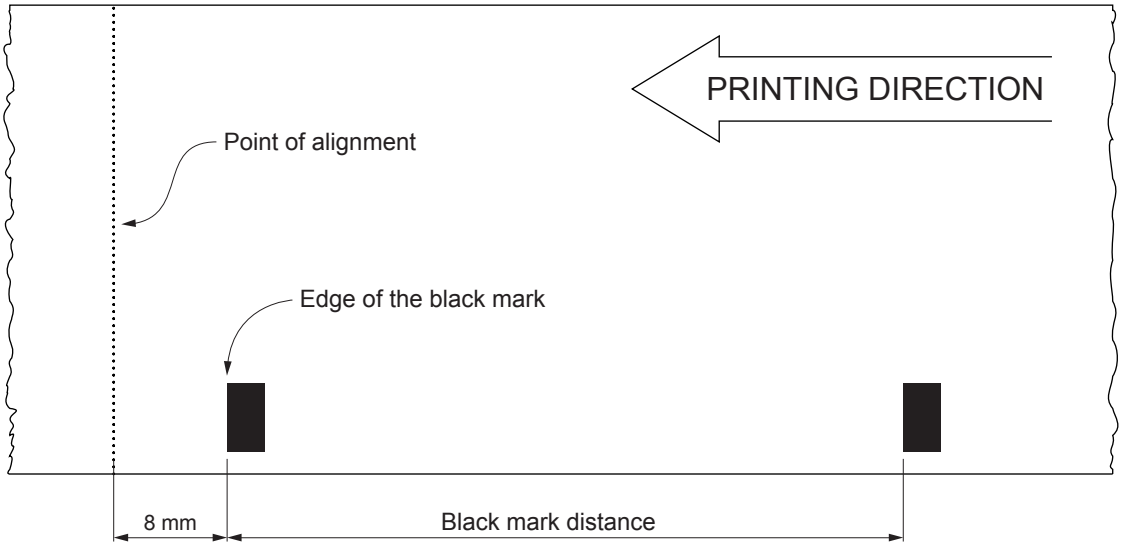
[Example] To set a distance of the alignment point from the black mark equal to 8 mm = 80 tenths of a millimeter, send the command:
0x1D 0xE7 0x00 0x50

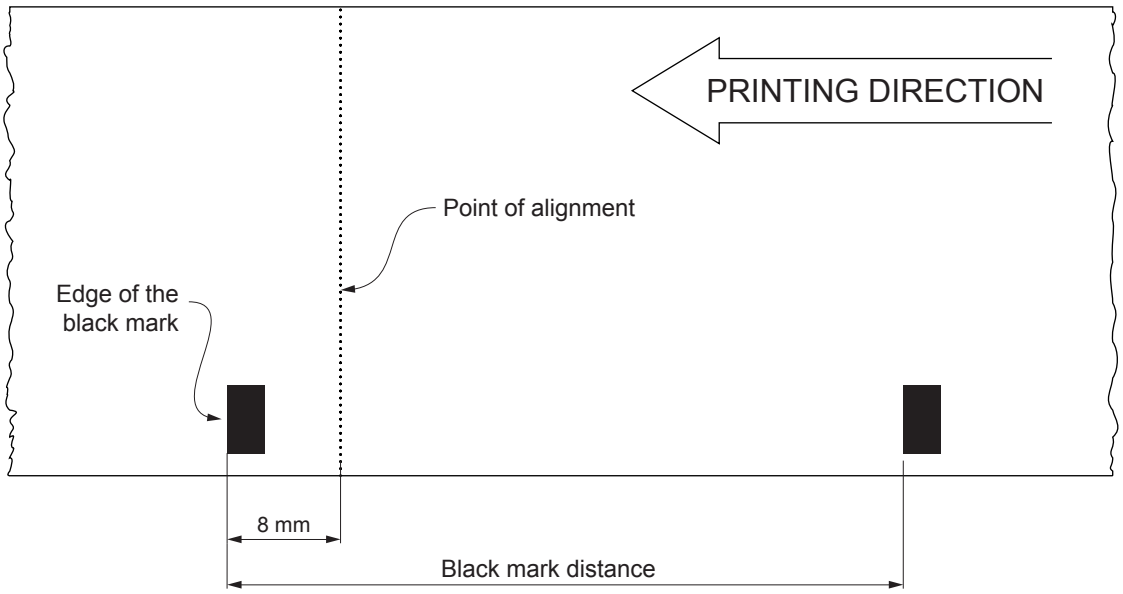
where:
0x00 the most significant bit (MSB = 0) defines the sign +
0x00 0x50 the absolute value defines the distance = 80 tenths of a millimeter

To set a distance of the alignment point from the black mark equal to - 8 mm, send the command:
0x1D 0xE7 0x80 0x50

where:
0x80 the most significant bit (MSB = 1) defines the sign -
0x80 0x50 the absolute value defines the distance = 80 tenths of a millimeter

The following images show tickets with alignment point positioned at 8 mm and -8 mm from the black mark.





To set a distance of the alignment point from the black mark equal to 30 mm = 300 tenths of a millimeter, send the command:
0x1D 0xE7 0x01 0x2C

where:

0x01	the most significant bit (MSB = 0) defines the sign +
0x01 0x2C	the absolute value defines the distance = 300 tenths of a millimeter

To set a distance of the alignment point from the black mark equal to -30 mm, send the command:
0x1D 0xE7 0x81 0x2C

where:

0x81	the most significant bit (MSB = 1) defines the sign -
0x81 0x2C	the absolute value defines the distance = 300 tenths of a millimeter

The following images show tickets with alignment point positioned at 30 mm and -30 mm from the black mark.

drv = 0x00
0x00 ≤ szHH, szHL, szLH, szLL ≤ 0xFF
0x00 ≤ d1, dsz ≤ 0xFF

[Description]

Loads a monochromatic .bmp file as a logo.
where:
• nH, nL identifies the 16-bit index of the logo.
• Kc1 and Kc2 2 bytes that indicate the Keycode. Keycode is 2 byte optional data to identify loaded image; its content is free for the user to select as a progressive number, file CRC or else.
• drv is the storage drive. Its value must be 0x00.
• szHH, szHL, szLH and szLL 4 bytes that indicate the bmp dimension in bytes.
sz = (szHH × 16777216) + (szHL × 65536) + (szLH × 256) + szLL indicates the number of bytes in the logo (4 bytes expressed in hexadecimal notation).
• d[1] ...d[sz] is the bmp image data.
• The image size depends on the amount of available memory on the device that you get by using the 0x1C 0x50 0x46, command.

[Notes]

• If command is not successful the device transmits the NACK (0x15), otherwise returns ACK (0x06) followed by 13 bytes as shown in the command 0x1C 0x50 0x49.
• Device does not perform any check on Keycode since it is just an identification number.

ASCII	FS	0x80	m

[Range] 0x00 ≤ m ≤ 0x03

[Description] Read date/time of the real time clock in the format specified by m values as follows:

m	FORMAT
0x00	DD/MM/YY hh:mm:ss
0x01	DDMMYYhhmmss
0x02	YYMMDDhhmmss
0x03	YYMMDDkkmmssd

where:

DD	represents the day of the date
MM	represents the month of the date
YY	represents the year of the date
hh	represents the hour of the time
mm	represents the minutes of the time
ss	represents the seconds of the time
d	represents the day of the week

[Notes] Before send the date/time, if the m parameter is valid the device transmits the ACK (0x06) followed by the number of bytes to sent, otherwise return NACK (0x15).

[Default]

[Reference]

[Example] To read date/time in the “DDYYMMhhmmss” format, send the command sequence:
0x1C 0x80 0x01

If the current date/time are “15 September 2006 at 10:56:20 (AM)”, the device answers as follows:

in Hex:	0x06 0x0C 0x31 0x35 0x30 0x39 0x30 0x36 0x31 0x30 0x35 0x36 0x32 0x30
in ASCII:	ACKFF150906105620

Read date/time of the real time clock

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format]

Hex	1C	81	m	n	d0...dn
ASCII	FS	0x81	m	n	d0...dn

[Range]

0x00 ≤ m ≤ 0x03
0x00 ≤ d0, dn ≤ 0xFF

[Description]

Read date/time of the real time clock in the format specified by m values as follows:

m	FORMAT
0x00	DD/MM/YY hh:mm:ss
0x01	DDMMYYhhmmss
0x02	YYMMDDhhmmss
0x03	YYMMDDkkmmssd

where:

DD	represents the day of the date
MM	represents the month of the date
YY	represents the year of the date
hh	represents the hour of the time
mm	represents the minutes of the time
ss	represents the seconds of the time
d	represents the day of the week

- n specifies the number of characters to send.
- d0...dn are the ASCII characters relative to the date and time to set.

[Notes]

- If the transmission has been received correctly and the command is valid, the device returns the ACK (0x06), otherwise returns NACK (0x15).
- The day of the week is calculated automatically from the device and then it's possible that the returned value is different from the one transmitted.

[Format]	Hex	1C	84	n	d1...dk	0x00
	ASCII	FS	0x84	n	d1...dk	NUL

[Range]
n = 0x44, 0x54
0x00 ≤ d0, dK ≤ 0xFF

[Description]
Sets the format string for date and time used to printing.
• n specifies which user-defined string format is set:
- 0x44 for date
- 0x54 for time

• d0..dk are the ASCII characters relative to user-defined date/time formats.
• The maximum length of the user-defined date/time format string is 64 chars.
• The following table shows characters used to create user-defined date/time formats:

CHARACTER	DESCRIPTION
I	Select Italian language
E	Select English language (default language)
c	Select default data/time
d	Displays the day as a number without a leading zero (1-31)
dd	Displays the day as a number with a leading zero (01-31)
ddd	Displays the day as an abbreviation (for example, Sun)
dddd	Displays the day as a full name (for example, Sunday)
ddddd	Displays the date as a complete date in the short format where date values are formatted with day, month and year (the short date format is dd/mm/yy)
dddddd	Displays the date as a complete date in the extended format where date values are formatted with day, month and year (the extended date format is dd mmmm, yyyy)
m	Displays the month as a number without a leading zero (1-12). If the character m is immediately after the character h or hh ,displays the minutes instead of month (see also the n character formatting)
mm	Displays the month as a number with leading zeros (01-12). If the character m is immediately after the character h or hh , displays the minutes instead of month (see also the nn character formatting)
mmm	Displays the month as an abbreviation (for example, Jan)
mmmm	Displays the month as a full month name (for example, January)

yy	Displays the year in two-digit numeric format with a leading zero
yyyy	Displays the year in four digit numeric format

CHARACTER	DESCRIPTION
h	Displays the hour as a number without leading zeros (0-23)
hh	Displays the hour as a number with leading zeros (00-23)
n	Displays the minutes as a number without leading zeros (0-59)
nn	Displays the minutes as a number with leading zeros (00-59)
s	Displays the seconds as a number without leading zeros (0-59)
ss	Displays the seconds as a number with leading zeros (00-59)
ttttt	Displays the time in the extended format where time values are formatted with hour, minutes and seconds (the extended time format is h:mm:ss).
AM/PM	Using the 12-hour clock and displays the AM prefix in uppercase next to the hours that preceding midday and the PM prefix in uppercase next to the hours between midday and midnight.
am/pm	Using the 12-hour clock and displays the am prefix in lowercase next to the hours that preceding midday and the pm prefix in lowercase next to the hours between midday and midnight.
A/P	Using the 12-hour clock and displays the A prefix in uppercase next to the hours that preceding midday and the a prefix in uppercase next to the hours between midday and midnight.
a/p	Using the 12-hour clock and displays the a prefix in lowercase next to the hours that preceding midday and the a prefix in lowercase next to the hours between midday and midnight.

[Notes] The device returns ACK (0x06) if the transmission is OK otherwise NACK (0x15).

[Example] To print the current time with the string format ‘yy/mm/dd hh:mm:ss’ follow these steps:

1. Send the following command to define the user-defined time string format:
0x1C 0x84 0x54 0x79 0x79 0x2F 0x6D 0x6D 0x2F 0x64 0x64 0x20 0x68 0x68 0x3A 0x6E 0x6E 0x3A 0x73 0x73 0x00

2. Send the following command to print the time:
0x1C 0x83 0x0A

The character 0x0A feeds one line based on the current line spacing.
If the date and time is 22 October 2006 at 17:35:27 (PM) the output string printed will be:
06/10/22 17:35:27

[Format 2]	Hex	1C	C0	18	10	14	1B
	ASCII	FS	0xC0	CAN	DLE	DC4	ESC

[Range]

[Description] When this command is received, the device perform an hardware reset (like a device power-up).

[Notes] This command is executed immediately, even when the data buffer is full (Busy).

Format 1:
The command execution stop the communication with host.

Format 2:
The command execution keep the communication with host active.

Hex	1D	49	n
ASCII	GS	I	n

[Range]

0x01 ≤ n ≤ 0x03
0x31 ≤ n ≤ 0x33
n = 0xFF

[Description]

Transmits the device ID specified by n follows:

n	DEVICE ID	SPECIFICATION
0x01, 0x31	Device model ID (1 byte)	0xFF (resend the command with n = 0xFF)
0x02, 0x32	Type ID	See table below
0x03, 0x33	ROM version ID (4 bytes)	Depends on ROM version (4 character)
0xFF	Device model ID (2 bytes)	0x02 0x42

n = 0x02, 0x32 Type ID

BIT	OFF/ON	HEX	FUNCTION
0	Off	00	2 bytes characters codes not supported
1	Off	00	Autocutter not supplied
	On	02	Autocutter supplied
2	Off	00	Thermal paper w/o label
	On	04	Thermal paper label
3	-	-	Undefined
4	Off	00	Not used. Fixed to off
5	-	-	Undefined
6	-	-	Undefined
7	Off	00	Not used. Fixed to off

[Notes] This command is executed when the data is processed in the data buffer. Therefore, there could be a time lag between command reception and data transmission, depending on data buffer status.

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format]

Hex	1D	50	x	y
ASCII	GS	P	x	y

[Range] 0x00 ≤ x, y ≤ 0xFF

[Description] Sets the horizontal and vertical motion units to 1/x inch and 1/y inch respectively.
When x is set to 0, the default setting value is used.
When y is set to 0, the default setting value is used.

[Notes]
• The horizontal direction is perpendicular to the paper feed direction.
• In standard mode, the following commands use x or y, regardless of character rotation (upside-down or 90° clockwise rotation):

Commands using x: 0x1B 0x20, 0x1B 0x24, 0x1B 0x5C, 0x1D 0x4C, 0x1D 0x57.
Commands using y: 0x1B 0x33, 0x1B 0x4A.

• This command does not affect the previously specified values.
• The calculated result from combining this command with others is truncated to the minimum value of the mechanical pitch or an exact multiple of that value.

[Default] x = 0xCC, y = 0x198

[Format]

Hex	1D	E6	nH	nL
ASCII	GS	0xE6	nH	nL

[Range]

0x00 ≤ nH≤ 0xFF
0x00 ≤ nL ≤ 0xFF

[Description]

This command sets the limit, expressed in cm as [(nH × 256) + nL], after which is pointed out the virtual paper-end.

[Notes]

[Default]

nH = 0x00
nL = 0xF0

[Reference]

[Example]

To see the virtual paper-end is pointed out after 15 metres from the first detection of low paper, it's necessary convert 15 metres in 1500 centimetres and then, calculate nH and nL value in the following mode:

nH = 1500 / 256 = 5
nL = 1500 - (nH × 256) = 1500 - (5 × 256) = 220

and then send the following command:
0x1D 0xE6 0x05 0xDC

[Format]	Hex	1D	E8	n
	ASCII	GS	0xE8	n

[Range] 0x2D ≤ n ≤ 0xFF

[Description] This command sets the minimum ticket length to the n value.

[Notes] Set values between 45 mm and 255 mm. Values lower than those specified are ignored.

[Default] n = 0x2D = 45 mm

[Reference]

[Example] To set the minimum ticket length at 80 mm, the command sequence will be:
0x1D 0xE8 0x00 0x50

0x1D 0xF0

[Format]

Hex	1D	F0	n
ASCII	GS	0xF0	n

[Range] 0x00 ≤ n ≤ 0x02

[Description] Sets print mode based on the value of n as follows:

n	PRINT MODE
0x00	High quality
0x01	Normal
0x02	High speed

[Notes] Print mode reverts to the default value when the device is reset or turned off.

[Default] n = 0x02

[Format]	ASCII <VPD>
[Range]	
[Description]	Transmits the size of an image file of the scan carried out through the optional upper scanner.
[Notes]	• The device transmits the size of an image file in 4 bytes. • The return order is inverted. The lowest value is the first received. • This command is active only if the additional barcode reading function has been enabled for the optional upper scanner.
[Default]	
[Reference]	<VPR>
[Example]	If the size of an image is 1000 bytes, the device returns 0xE8 0x03 0x00 0x00 instead of 0x00 0x00 0x03 0xE8.

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <VPR>

[Range]

[Description] Receive the barcode image file read from the optional upper scanner.

[Notes]
- If no image is present, the device returns NACK (0x15).
- This command returns all data of the .bmp image.
- This command is active only if the additional barcode reading function has been enabled for the optional upper scanner.

[Format] ASCII <B2D k, A, x>

[Range] 0 ≤ x ≤ 30

[Description] Set the number of columns of PDF417 barcode.
• x = 0 specifies auto processing
• When x is not 0, specifies the number of columns of the data area as x code word.
• When auto processing (x = 0) is specified, the maximum number of columns in the data area is 30 columns.

[Notes]

[Default] x = 0

<B2D k, E, m, x>

Set the error correction level of the PDF417 barcode

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR
	KPM862 EJ, KPM863 EJ, TK862 EJ
	KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL
	KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ
	KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <B2D k, E, m, x>

[Range] m = 0, 1
m = 0 0 ≤ x ≤ 8
m = 1 1 ≤ x ≤ 40

[Description] Set the error correction level of PDF417 barcode.

- m = 0 the error correction level is specified by “level”
- m = 1 the error correction level is specified by “ratio” [x * 10%]

[Notes]
- Error correction level is specified by either “level” or “ratio”.
- Error correction level specified by “level” (m = 0) is as follows. The number of the error correction code word is fixed regardless of the number of code words on the data area.

x	FUNCTION	N. OF ERROR CORRECTION CODE WORD
0	Error correction level 0	2
1	Error correction level 1	4
2	Error correction level 2	8
3	Error correction level 3	16
4	Error correction level 4	32
5	Error correction level 5	64
6	Error correction level 6	128
7	Error correction level 7	256
8	Error correction level 8	512

- Error correction level specified by “ratio” (m = 1) is as follows. The error correction level is defined by the calculated value [number of data code word * x * 0.1 = (A)]. The number of the error correction code word is changeable in proportion to the number of the code words on the data area.

CALCULATED VALUE (A)	CORRECTION LEVEL	N. OF ERROR CORRECTION CODE WORD
0 - 3	Error correction level 1	4
4 - 10	Error correction level 2	8
11 - 20	Error correction level 3	16
21 - 45	Error correction level 4	32
46 - 100	Error correction level 5	64
101 - 200	Error correction level 6	128
201 - 400	Error correction level 7	256
400 or more	Error correction level 8	512

• The error correction code word calculated by modulus 929.

[Default] m = 1, x = 1 [ratio: 10%]

[Format] ASCII <B2D k, P, x, d1...dk>

[Range]

[Description] Store the PDF417 barcode data (d1...dk) in the barcode save area.
• x = number of characters (= dk)
• d1...dk = barcode data

[Notes] • n bytes of d1...dk are processed as barcode data.
• Specify only the data code word of the barcode with this function. Be sure not to include the control data in the data d1...dk because they are added automatically by the device.

<B2D l, P, x, d1...dk>

Store the two-dimensional DATAMATRIX barcode data in the barcode save area

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <B2D l, P, x, d1...dk>

[Range]

[Description] Store the DATAMATRIX barcode data (d1...dk) in the barcode save area.
• x = number of characters (= dk)
• d1...dk = barcode data

[Notes] • n bytes of d1...dk are processed as barcode data.
• Specify only the data code word of the barcode with this function. Be sure not to include the control data in the data d1...dk because they are added automatically by the device.

<B2D m, A, x>

Specify encoding scheme of AZTEC barcode

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <B2D m, A, x>

[Range] x = 0, 1

[Description] Specifies encoding type of AZTEC barcode.

x	ENCODING
0	FULL AZTEC
1	AZTEC RUNE

[Notes]
- FULL AZTEC encodes all extended ASCII characters data up to a maximum length of approximately 3823 numeric or 3067 alphabetic characters or 1914 bytes of data.
- AZTEC RUNE is a compact AZTEC code, sometimes called SMALL AZTEC CODE. Encode all numbers from 0 to 9 up to a maximum length of 3 numbers.

[Default] x = 0

<B2D m, B, x>

Specify dot size of the module of the AZTEC barcode

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <B2D, m, B, x>

[Range] 2 ≤ x ≤ 24

[Description] Specifies numbers of dot for each pixel of AZTEC barcode.

[Notes]

[Default] x = 0

[Example]

<B2D m, C, x>

Specify AZTEC barcode size

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <B2D m, C, x>

[Range] 0 ≤ x ≤ 36

[Description] Specifies AZTEC barcode format (rows and columns), as follows:

x	FORMAT	x	FORMAT	x	FORMAT
0	AUTO	13	C53X53	26	C109X109
1	C15X15 Compact	14	C57X57	27	C113X113

[Format] ASCII <B2D m, D, x>

[Range] 0 ≤ x ≤ 4

[Description] Specifies the ECC level (Error Correction Capability) of AZTEC barcode.

x	ECC LEVEL
0	AUTO
1	> 10 % + 3 codewords
2	> 23 % + 3 codewords
3	> 36 % + 3 codewords
4	> 50 % + 3 codewords

It is not possible to select both barcode size and error correction capability for the same barcode. If both options are selected then the error correction capacity selection will be ignored.

[Format] ASCII <B2D n, A, x>

[Range] 0 ≤ x ≤ 1

[Description] Specifies encoding type of QRcode barcode.

x	ENCODING
0	QRcode
1	MicroQR

[Notes]
- QRcode encodes all extended ASCII characters data up to a maximum length of 7089 numeric digits, 4296 alphabetic characters or 2953 bytes of data.
- MicroQR is a miniature version of the QRcode for short message. Encode all numbers from 0 to 9 up to a maximum length of 35 characters.

[Notes]

• A proportional font is a font in which different characters have different pitches (widths).
• A ixed font is the opposite of a proportional font and is a ixed-pitch font.
• The fonts with the same name and dimension contain different characters in different positions from theirs.
• During power-up, if the FORM FEED (FF) key is held down, the device executes the FONT TEST.

• In SVELTA emulation, it is possible to use TrueType fonts. True Type fonts are printable with every angle of rotation and in bold, reverse, italic and underlined mode.
• It is possible to address the TrueType font respects the UNICODE™ standard (see www.unicode.org), by using UTF-8 or UTF-16 encoding.
• For the correct printing of the code tables, it is necessary that the selected TrueType font contains all the characters in the tables. Otherwise, the '□' symbol will be printed instead the missing character.

<HW height, width>

Set height and width of the current font

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <HW height, width>

[Range]

[Description] Modifies the height and width of the current font where height and width are the multiplier coefficients of height and width of how enlarge the font. Both values can be:

height/ width	FONT DIMENSION
1	Font dimension ×1
2	Font dimension ×2
3	Font dimension ×3
4	Font dimension ×4
5	Font dimension ×5
6	Font dimension ×6
7	Font dimension ×7
8	Font dimension ×8

[Notes] The command is ignored if height or width has different value from that reported above.

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <F:err:n>

[Range] n = 0, 1

[Description] Get the last error functioning with n, where
n = 0 Get last error
n = 1 Get last error + internal error code

If n = 0, the reply will be <F:err:k>
where k specifies the error code as described in the following table:

k	ERROR TYPE	ERROR DESCRIPTION
0	NO ERR	No error
1	INVALID PATH	The file path is invalid
2	FILE NOT FOUND	File not found
3	FILE ERROR	File opening error, file generic error or incorrect file type
4	OUT OF MEMORY	Out of memory error
5	INTERNAL ERROR	Internal error

If n = 1, the reply will be <F:err:k-m>
where:
k specifies the error code as specified in the previous table.
m specifies the internal error code, expressed in hexadecimal value (from 0x00 to 0xFF).

[Notes]
- Use this command to know if an error occurs during the execution of commands for TrueType fonts management (as <F:filename.ttf> or <F:clear>).
- To know the internal error codes list, contact customer service.
- This command is active only with TrueType fonts.

[Format] ASCII <p>

[Range]

[Description] This command executes the following operations:
- align the ticket to notch (based on the alignment set with the <LHT> command)
- barcode reader turn on (only for models with BARCODE reader)
- prints ticket
- clear the data in the print buffer
- align the ticket to cut
- executes a ticket cut
- recovers the portion of paper equal to the distance between autocutter and printhead.

[Notes]
• Print ticket in reverse.
• After printing, the data of the barcode read and the reading result, are stored in a circular buffer.
• To read the barcode acquired during printing, use the <BC 1> or <BC M> commands.

- prints ticket
- clear the data in the print buffer
- align the ticket to cut
- executes a ticket cut
- recovers the portion of paper equal to the distance between autocutter and printhead.

[Notes]
• Print ticket in normal
• After printing, the data of the barcode read and the reading result are stored in a circular buffer.
• To read the barcode acquired during printing, use the <BC 1> or <BC M> commands.

<PP n, x, y, sp>

Print image in graphic page

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <PP n, x, y, sp>

[Range]

[Description] Prints image in graphic page where
- n is the number of image to print;
- x indicates the horizontal position inside the graphic page
- y indicates the vertical position inside the graphic page
- sp indicates the thickness value of the image border (express in dot).

[Notes] If n is a negative number the image is printed as a background image, without deleting the area below.

[Default]

[Reference] <OXY x, y>

[Example] Several printing commands in graphic page; in the first printing command the image no. 2 is printed with border, instead the other images are printed without border:

```
<CB><n><BA8><HW1,1><BS0,0>
<PP2,10,10,8>          (image printed with border)
<PP1,10,200,0>         (image printed without border)

	KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <TDF m data>

[Range]

[Description] Sets the format string for date and time used to printing.

• m specifies which user-defined string format is set
D for date
T for time

• data are the ASCII characters relative to user-defined date/time formats.
• the maximum length of the user-defined date/time format string is 64 chars.

The following table shows characters used to create user-defined date/time formats:

CHARACTER	DESCRIPTION
I	Selects Italian language
E	Selects English language (is the default language)
c	Selects default date/time
d	Displays the day as a number without a leading zero (1-31)
dd	Displays the day as a number with a leading zero (01-31)
ddd	Displays the day as an abbreviation (for example, Sun)
dddd	Displays the day as a full name (for example, Sunday)
ddddd	Displays the date as a complete date in the short format where date values are formatted with day, month and year (the short date format is dd/mm/yy)
dddddd	Displays the date as a complete date in the extended format where date values are formatted with day, month and year (the extended date format is dd mmmm, yyyy)
m	Displays the month as a number without a leading zero (1-12). If the character m is immediately after the character h or hh , displays the minutes instead of month (see also the n character formatting)
mm	Displays the month as a number with leading zeros (01-12). If the character m is immediately after the character h or hh , displays the minutes instead of month (see also the nn character formatting)
mmm	Displays the month as an abbreviation (for example, Jan)
mmmm	Displays the month as a full month name (for example, January)

yy	Displays the year in two-digit numeric format with a leading zero
yyyy	Displays the year in four digit numeric format

CHARACTER	DESCRIPTION
h	Displays the hour as a number without leading zeros (0-23)
hh	Displays the hour as a number with leading zeros (00-23)
n	Displays the minutes as a number without leading zeros (0-59)
nn	Displays the minutes as a number with leading zeros (00-59)
s	Displays the seconds as a number without leading zeros (0-59)
ss	Displays the seconds as a number with leading zeros (00-59)
ttttt	Displays the time in the extended format where time values are formatted with hour, minutes and seconds (the extended time format is h:mm:ss)
AM/PM	Using the 12-hour clock and displays the AM prefix in uppercase next to the hours that preceding midday and the PM prefix in uppercase next to the hours between midday and midnight
am/pm	Using the 12-hour clock and displays the am prefix in lowercase next to the hours that preceding midday and the pm prefix in lowercase next to the hours between midday and midnight
A/P	Using the 12-hour clock and displays the A prefix in uppercase next to the hours that preceding midday and the a prefix in uppercase next to the hours between midday and midnight
a/p	Using the 12-hour clock and displays the a prefix in lowercase next to the hours that preceding midday and the a prefix in lowercase next to the hours between midday and midnight

[Example] To print the current time with the string format ‘yy/mm/dd hh:mm:ss’ follow these steps:

1. Send the following command to define the user-defined time string format:
<TDF T yy/mm/dd hh:mm:ss>

2. Send the following command to print the time:
<TIME>

If the date and time is 22 October 2006 at 17:35:27 (PM) the output string printed will be:
06/10/22 17:35:27

- y is an optional parameter; if y = ‘F’ then enables the transmission of the dual feeder status.

[Notes] The device answer will be composed as follows:

<SB x, CHR1 ..... CHRn>

where:

SB	=	fixed characters
x	=	is the bitmask to identify the request
CHR1..CHRn	=	response bytes referred to the following tables:

The device transmits bytes 1,2,3,4 and 6 as a pair of hexadecimal characters (between ‘0’ and ‘9’ or between ‘A’ and ‘F’). For example the first byte is equal to 0xA9, then will be sent from the device the characters ‘A’ (0x41) and ‘9’ (0x39).

To request the Full status (1° byte) and the User status (2°byte) proceed as follow:

see bit mask:
BIT3 = 0 BIT2 = 0 BIT1 = 1 BIT0 =1 then 0011 = 3

Send the command: <AFSB3>

Status request

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <S n>

[Range] n = 1, 3

[Description] The host can ask to the device many different status info; the n parameter indicates which type of request:

If n = 1, the device returns a byte that represent the status:

0x10	Paper end
0x11	No error
0x19	Wrong command
0x20	Notch error
0x21	Print head over temperature error
0x22	Power supply voltage error
0x23	Autocutter error

If n = 3, the device returns ACK (0x06) if printing is properly finished, otherwise return NACK (0x15). If the request will be transmitted during printing phase, it waits the end of the process and then is sent the answer.

[Format] ASCII <BF x1,y1,x2,y2>

[Range]

[Description] Create a filled box on the basis of x1, y1, x2, y2 coordinates where :
x1 = minimum horizontal coordinate
y1 = minimum vertical coordinate
x2 = maximum horizontal coordinate
y2 = maximum vertical coordinate

[Notes]
- If the coordinates are reversed, the device automatically turns the points to create in any case the box.
- If the x2 is greater than the maximum horizontal width of graphic page, the box is drawn using the maximum width as last point.
- If the y2 is greater than the maximum length of graphic page defined by <LHT> command, the box is drawn using the maximum length (defined by this command) as last point.

t	FILL MODE
0	Deletes area
1	Fills area
2..8	Fills area with specific pattern
9	The area leaves unchanged (only for rectangle border)

[Notes]
• If t > 9 the fill mode is set to 9.
• If the coordinates are reversed, the device automatically turns the points to create in any case the box.
• If the x2 is greater than the maximum horizontal width of graphic page, the box is drawn using the maximum width as last point.

• If the y2 is greater than the maximum length of graphic page defined by <LHT> command, the box is drawn using the maximum length (defined by this command) as last point.
• If the defined thickness is greater than the half of box width, then the thickness is set to the half of box width to print (filled box).
• This command is not active with TrueType fonts.

[Format] ASCII <OXY x, y>

[Range]

[Description] Sets an offset that will be added to all the transmitted positions, where:
x is the distance (in dot) between the ticket upper edge and the starting point of printing
y is the distance (in dot) between the ticket lateral edge and the starting point of printing.

This command is useful to adjusting the printout positions, without having to modify all the transmitted positions.

[Notes] • If using the point character '.' as decimal separator instead of commas then the passed value are stored in EEPROM.
• It's possible to set negative values of offset.
• If you get negative values after adding the offset, (the printing position is outside the ticket), the printing position is set to 0.

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

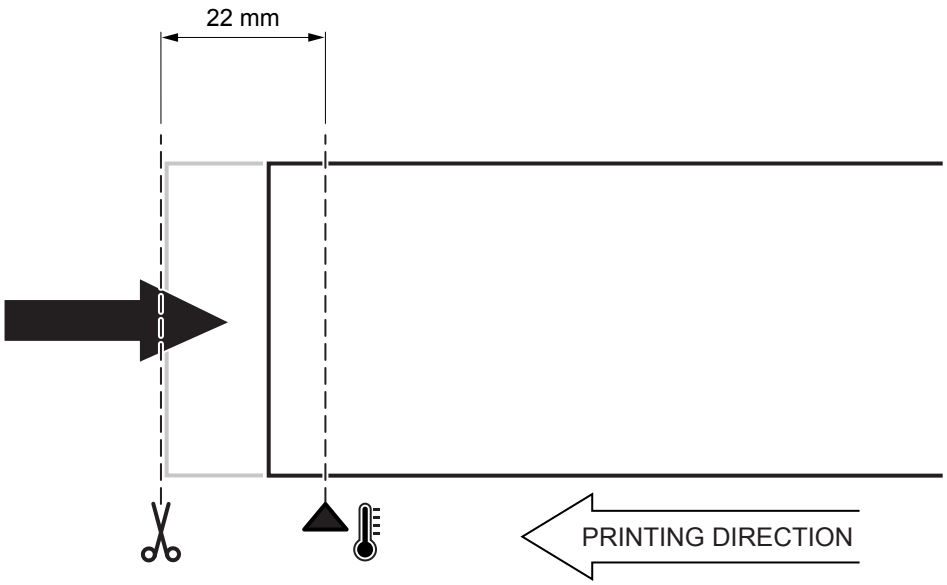
[Format] ASCII <CUTREC1>

[Range]

[Description] Enable the automatic paper moving toward the print head after the paper cut.



[Notes] The device automatically perform a complete recover of 22 mm of paper (mechanical distance between print head and autocutter.

[Default]

<SP n>

Change speed

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <SP n>

[Range]

[Description] Sets printing speed using n as follows:

n	PRINTING SPEED
0	High quality
1	Normal
2	High speed

[Example]

<LHT length, height, notch, dimnotch>

Set ticket dimension to print

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <LHT length, height, notch, dimnotch>

[Range]

[Description] Sets the ticket dimension to print in the following mode:

length is the ticket length (in dot)
height is the ticket height (in dot)
notch is the distance (in dot) between the ticket upper edge and strobe backside preprinted black mark
dimnotch is the notch dimension (in dot)

[Notes]

- If using the point (.) character as decimal separator instead of commas then the passed value are stored in nonvolatile memory.
- The parameters are saved in nonvolatile memory: it is therefore recommended not to send this command for each printed ticket, because the number of rewrites is limited. In many devices, however, is checked the diversity of the data before performing the rescue to avoid reaching the limit of rewrites.
- The parameters defined by this command are the same that can be set by modifying the same parameters of the “Setup.ini” file (see user manual for further explanation).

KPM862 STD, TK862 STD,
KPM862 EJ, KPM862 vSEL,
KPM862 DF, KPM862 DF-EJ, KPM862 DF-hSEL, KPM862 DF-vSEL, TK862 DF

- 1 mm = 8 dot.

KPM863 STD
KPM863 EJ, KPM863 vSEL

- 1 mm = 12 dot.

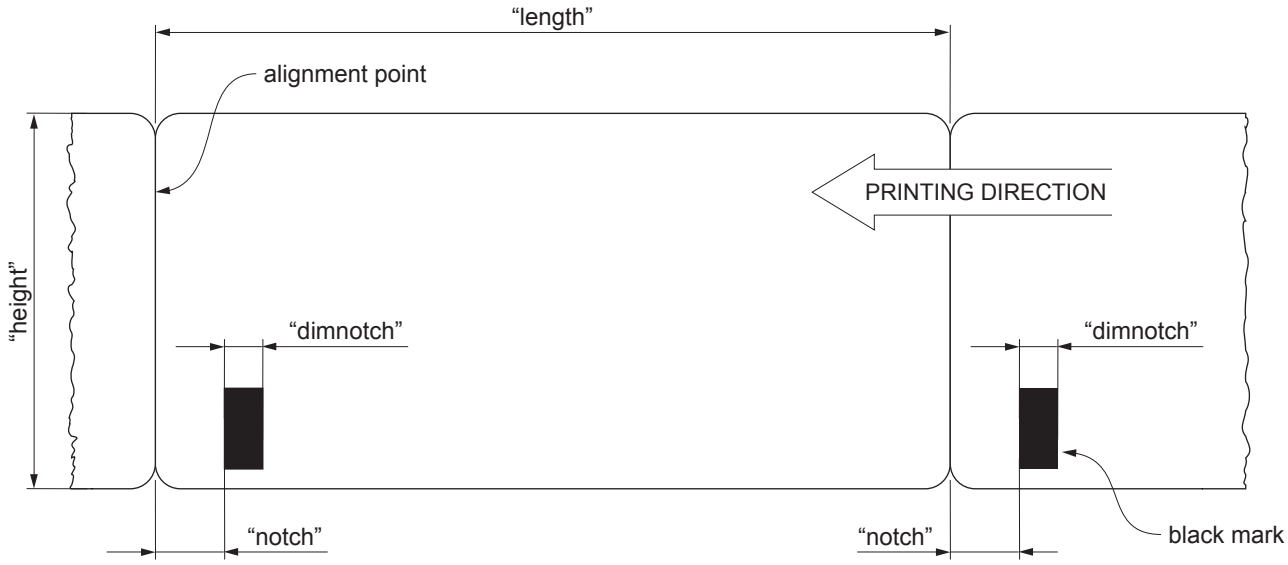
[Example] The following image shows a ticket with the parameters set by this command:



<EJOUT>

Perform ticket ejection

Valid for	KPM862 EJ, KPM863 EJ, KPM862 DF-EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF-hSEL, KPM862 DF-vSEL

[Format] ASCII <EJOUT>

[Range]

[Description] This command performs the ejection of the printed ticket.

[Notes]

[Default]

[Example]

<EJECT0>

Disable the automatic ejection of the ticket

Valid for	KPM862 EJ, KPM863 EJ, KPM862 DF-EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF-hSEL, KPM862 DF-vSEL

[Format] ASCII <EJECT>

[Range]

[Description] This command disable the automatic ejection of the printed ticket. The ticket is issued in presentation mode.

[Notes] With automatic ejection disabled, it is anyway possible to eject the ticket by sending the eject command <EJOUT>.

[Default]

[Reference] <EJOUT>, <EJECT1>

[Example]

<EJECT1>

Enable the automatic ejection of the ticket

Valid for	KPM862 EJ, KPM863 EJ, KPM862 DF-EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF-hSEL, KPM862 DF-vSEL

[Format] ASCII <EJECT1>

[Range]

[Description] This command enable the automatic ejection of the printed ticket.

[Notes]

[Default]

[Reference] <EJOUT>, <EJECT0>

[Example]

<SELECTORI>

Initialize selector

Valid for	KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF-hSEL, KPM862 DF-vSEL

[Format] ASCII <SELECTORI>

[Range]

[Description] This command performs a movement of the selector mechanisms in the two available positions.
If the selector is mechanically unable to move, the flag status indicates an error.

[Notes] At the end of the movement, selector is set in the “Open” position (default).

[Default]

[Reference]

[Example]

<SELECTORO>

Set selector in “Open” position

Valid for	KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF-hSEL, KPM862 DF-vSEL

[Format] ASCII <SELECTORO>

[Range]

[Description] This command set the selector in the “Open” position: the paper exits the device regularly.
If the selector position is already the desired one, this command does not generate any movement.

[Notes]

[Default]

[Reference]

[Example]

<SELECTORS>

Set selector in “Storage” position

Valid for	KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF-hSEL, KPM862 DF-vSEL

[Format] ASCII <SELECTORS>

[Range]

[Description] This command set the selector in the “Storage” position: paper exits the device downwards.
If the selector position is already the desired one, this command does not generate any movement.

<PCHexNumLogo HexXDim HexYDim HexTBD Id Hexdata>

Save image into flash

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR
	KPM862 EJ, KPM863 EJ, TK862 EJ
	KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL
	KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ
	KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <PCHexNumLogo HexXDim HexYDim HexTBD Id Hexdata>

[Range]

[Description] Save the image received from serial port into device flash; if the number used to store logo is not already present inside the device, the new logo is appended to stored logos, otherwise the image is overwritten and moved in the last position of flash.

• The source image must be a monochrome bitmap.

HexNumLogo indicates the number of logo, 2 bytes expressed in hexadecimal notation.

HexXDim indicates the logo horizontal dimension in pixel, 2 bytes expressed in hexadecimal notation; the value must be multiple of 32.

HexYDim indicates the logo vertical dimension in pixel, 2 bytes expressed in hexadecimal notation.

HexTBD 2 bytes fixed to 0x00 (for future use).

Id indicates the file-name of the logo, a sequence of 16 bytes that identify uniquely the logo.

Hexdata are the image data (logo's bytes less than the first 62 bytes of the header).

• The device returns a sequence of bytes as follows :

<PC0> if the saving include an incorrect syntax or the available memory in flash for logos is finished.

<PC1n> if the syntax command is correct and there's enough memory in flash for saving logos; n returns the status of the flash programming:

0x88 Sector not erased.

0x77 Error during programming.

0xAA Programming done.

[Notes] • The logo is stored into the device flipped vertically relative to the bitmap

• The colors of monochrome bitmaps may appear reversed if the "palette" in the header of the bitmap in position 0x3B is 0xFF 0xFF 0xFF 0x00.

- If file-name length is shorter than 16 byte, add a terminator byte NULL (0x00) up to 16 characters.
- If file-name extension is absent, it is automatically added to the name.

[Default]

[Reference]

[Example] The following example shows the bytes sequence received from serial port to store a logo into the device flash:

```
Offset      Hexadecimal                                                 ASCII
00000000:   3C 50 43 00 08 00 60 00 58 00 00 65 78 61 6D 70 <PC...`.X..examp
00000010:   6C 65 6C 6F 67 6F 38 00 00 00 00 00 00 00 00 2F lelogo8.bmp
....
....                                          Image data less than the first 62 bytes
....
>
```

If the programming is successful, the device answer will be:
<PC10xAA>

<PE n>

Delete image

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <PE n>

[Range]

[Description] Deletes image defined by n.
The device returns a sequence of bytes as follows :

<PE0>	Image n not found
<PE1n>	Image found; n returns to the flash programming status
	0x88 Sector not erased
	0x77 Error during erasing operation
	0xAA Erasing done.

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <PI n>

[Range]

[Description] Gets the logo header info stored specified by n (express in ASCII). The device returns a bytes sequence as follows:

<PIe[ID]>

where

- e indicates the search result:
  e = 0 picture not found
  e = 1 picture found
- [ID] indicates the file-name that identify the logo, a sequence of 16 bytes that was defined when the logo is stored. This field is optional because it's returned only if the logo has been found.

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <PL>

[Range]

[Description] This command requests to the device the list of stored logo. The device returns a bytes sequence as follows :

<PL CrLf [N-ID CrLf]>

where

- CrLf indicates the two characters 0x0D (Carriage return) and 0x0A (line feed)
- N is the number of stored logo
- [ID] indicates the file-name that identify the logo, a sequence of 16 bytes that was defined when the logo is stored. This field is optional because it's returned only if the logo has been found.

[Notes] The fields enclosed in square bracket are repeated for all number of stored images.

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <PN>

[Range]

[Description] This command sends to the device the request of number of stored logo; the device returns a bytes sequence as follows:

<PNn>

where
n (in ASCII format) indicates the number of stored images.

[Notes]

[Default]

<DT m>

Read date and time

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <DT m>

[Range]

[Description] Read date and time of the real time clock and send it in the format specified by m values as follows:

m	FORMAT
0	DD/MM/YY hh:mm:ss
1	DDMMYYhhmmss
2	YYMMDDhhmmss
3	YYMMDDhhmmssd

where:

DD	represents the day of the date
MM	represents the month of the date
YY	represents year of the date
hh	represents the hour of the time
mm	represents the minutes of the time
ss	represents the seconds of the time
d	indicates the day of the week

The device answer will be:

<DT CR x data CR >

where
- x indicate the reading result; the x value can be :
‘!’ : the command is executed successfully
‘#’: the command is not executed successfully
- data are the ASCII characters that represent the date and time.

[Notes]

[Default]

[Reference]

[Example] To read date and time in the “DDMMYYhhmmss” format, send command:

<DT 1>

If the current date and time are “15 September 2006 at 10:56:20 (AM)” the device answer is as follows:

<DT CR ! 151006105620 CR> if the transmission is successfully.
<DT CR # CR > if the transmission is not successful.

<EPOS>

Change emulation to CUSTOM/POS

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <EPOS>

<IT>

Disable detection of alignment black mark

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <IT>

[Range]

[Description] Sent before the <MM n> feed command, this command disables the detection and counting of the alignment black mark.

[Notes]
- When you need to move paper outside the print job, you need to disable the detection and counting of the black marks by the alignment sensor to allow the device to properly position the paper at the end of the movement.
- Send this command always before <MM n> command and then enable the black mark detection with the <VT> command.

[Default]

[Example]

<KEYS x>

Enable or disable keys panel

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <KEYS x>

[Range] x = 0, 1

[Description] Enables or disables the keys panel.
• When x = 0, the keys panel is disabled.
• When x = 1, the keys panel is enabled.

[Notes] When the keys panel is disabled, the keys may only be used after the device has been reset.

[Default] x = 1

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <LOAD>

[Range]

[Description] When this command is received, the device performs a paper reloading.

[Notes]
- During the execution of the command, the device indicates the paper end.
- This command is valid only if the alignment is enabled.

[Default]

[Example]

<PARK n>

Park paper in the dual feeder (feeder 1, feeder 2)

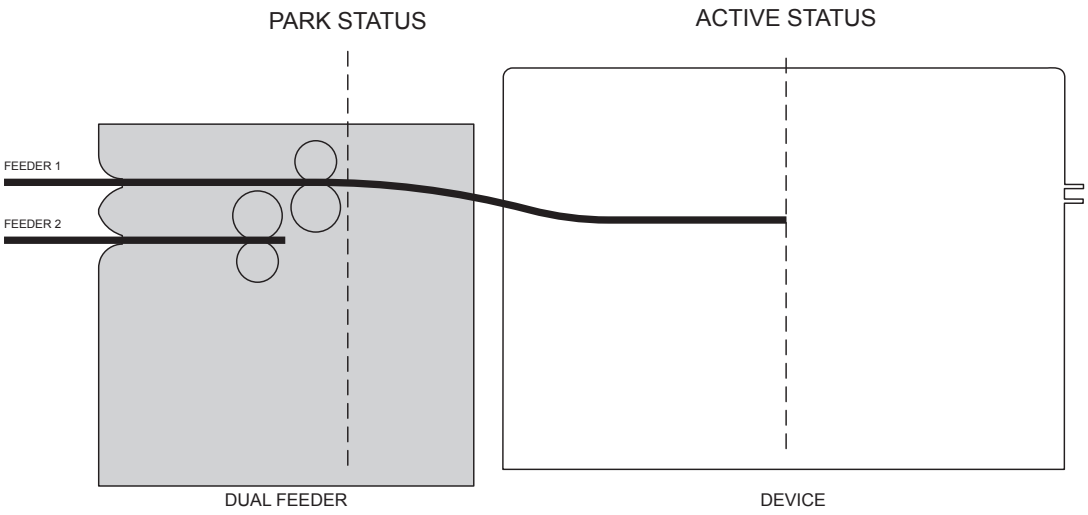
Valid for	KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <PARK n>

[Range] n = A, B

[Description] This command allows to park paper inside the two paper in feeder based on the following values of n:

n	PAPER FEEDER
A	feeder 1
B	feeder 2



[Notes]

[Default]

[Reference]

[Example] To park paper inside the feeder 1, the command sequence is:
<PARK A, a, 1>

To park paper inside the feede 2, the command sequence is:
<PARK B, b, 2>

<SDT m data>

mm	represents the minutes of the time
ss	represents the seconds of the time
d	indicates the day of the week
data	are the ASCII characters relative to the date and time to set

If the transmission has been received correctly and the command is valid, the device returns the following string:

<SDT CR x CR >

where
- x indicate the reading result; the x value can be:
‘!’ : the command is executed successfully
‘#’: the command is not executed successfully

[Notes] The day of the week is calculated automatically from the device and then it’s possible that the returned value is different from the one transmitted.

[Default]

[Reference]

[Example] To set the date and time to “29 September 2006 at 13:51:00 (PM)” in the “YYMMDDhhmmss” format send the command:

<SDT 2 061029135100>

The device answer will be:

<SDT CR ! CR > if the transmission is successfully
<SDT CR # CR > if the transmission is not successfully

<SVEL>

Change emulation to SVELTA

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <SVEL>

[Range]

[Description] Set the SVELTA emulation.

<TICKMIN>

Set minimum ticket length

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <TICKMIN n>

[Range] 0 ≤ n ≤ 255

[Description] This command sets the minimum ticket length to the n value.

[Notes] Set values between 45 mm and 255 mm. Values lower than those specified are ignored.

[Default] 45 mm

[Reference]

[Example] To set the minimum ticket length at 80 mm, the command sequence will be:
<TICKMIN 80>

<VT>

Enable detection of alignment black mark

Valid for	KPM862 STD, KPM863 STD, KPM862 VR, TK862 STD, TK862 VR KPM862 EJ, KPM863 EJ, TK862 EJ KPM862 vSEL, KPM863 vSEL, KPM862 hSEL, KPM863 hSEL KPM862 DF, KPM862 DF-EJ, KPM862 DF-vSEL, KPM862 DF-hSEL, TK862 DF, TK862 DF-EJ KPM863 DF, KPM863 DF-EJ, KPM863 DF-vSEL, KPM863 DF-hSEL

[Format] ASCII <VT>

[Range]

[Description] Sent after the <MM n> feed command, this command enables the detection and counting of the alignment black mark.

[Notes]
- When you need to move paper outside the print job, you need to disable the detection and counting of the black marks by the alignment sensor by using the <IT> command to allow the device to properly position the paper at the end of the movement. The detection of black marks must be enabled whit this command.
- Send this command always after <IT> and <MM n> commands.

[Default]

[Reference] <IT>, <MM n>

ALIGNMENT

1 ALIGNMENT COMMANDS 406

1 ALIGNMENT COMMANDS

Devices listed in this manual are equipped with sensors that allow the use of alignment notch in order to handle:

- Rolls of with pre-printed and fixed length fields.
- FanFold modules of tickets with pre-printed and fixed length fields.

For further information, refer to the user manual of each device.

The commands available for managing the alignment of the ticket are the following:

- 0x1D 0xE7: sets the distance between the point of alignment and the notch (value of “Cut Distance” parameter).
- 0x1D 0xF6 and 0x1D 0xF8: perform the alignment of ticket, which is advanced to cut the ticket at the first alignment point available.
- 0x1C 0xC1: performs the desired recovery of the paper after the cutting operation.

Print a ticket with alignment requires the following sequence of commands:

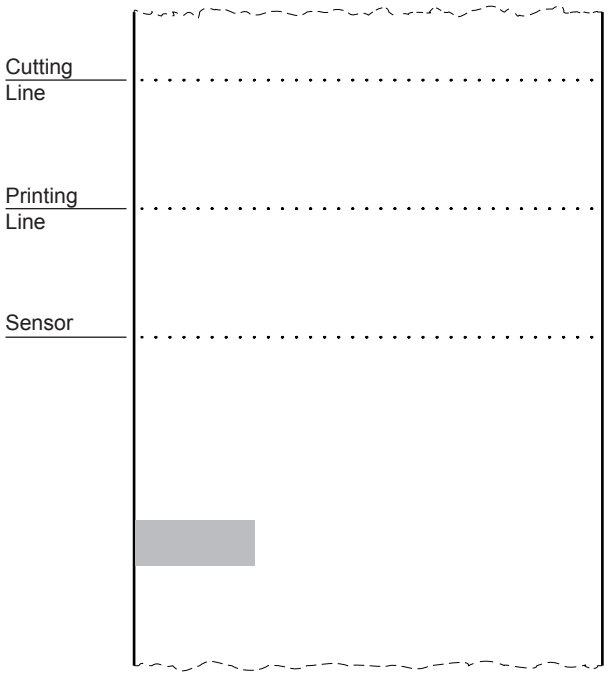
1. General settings of the ticket (character formatting, print density, margins etc.)
2. Alignment command: 0x1D 0xF6.
3. Ticket printout (printing text, logos or any graphic).
4. Alignment command: 0x1D 0xF8.
5. Cut command 0x1B 0x69.
6. Command for paper recovery 0x1C 0xC1 (optional).

The settings take effect from next ticket to the one already in the device.

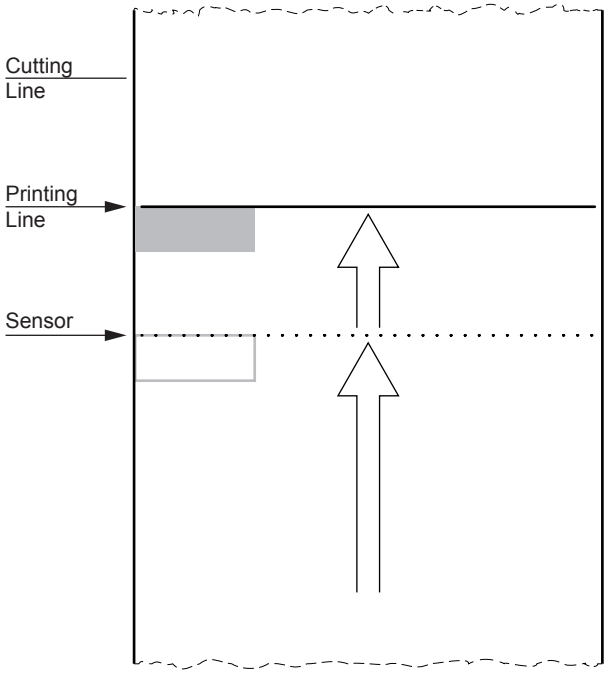
In the following examples, are described some sequences of commands to manage the alignment.

[Example 1] Commands sequence to print tickets with “alignment point” set to the edge of the notch (“Cut Distance” parameter = 0 mm set in the setup procedure) and with full paper recovery (0x1C 0xC1 0x16).

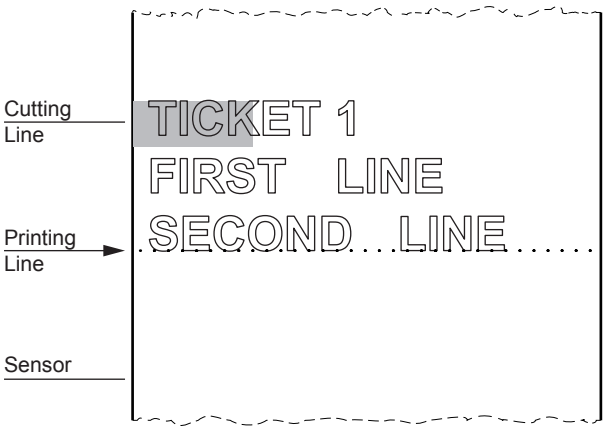
Start
Paper with black mark not aligned.



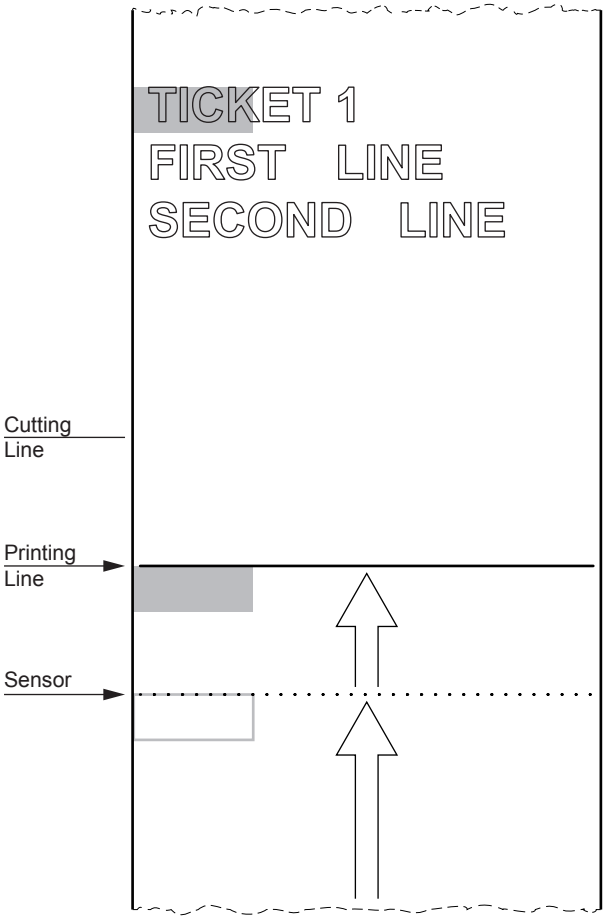
Alignment command 0x1D 0xF6.
Paper is fed. The black mark is recognized by the sensor and aligned under the printing line.



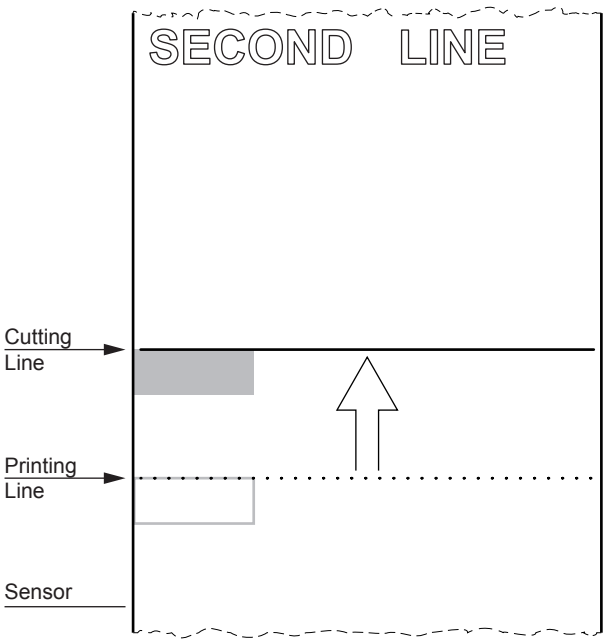
Command for text printing:
‘TICKET 1’, 0x0A, ’FIRST LINE’, 0x0A, ’SECOND LINE’, 0x0A



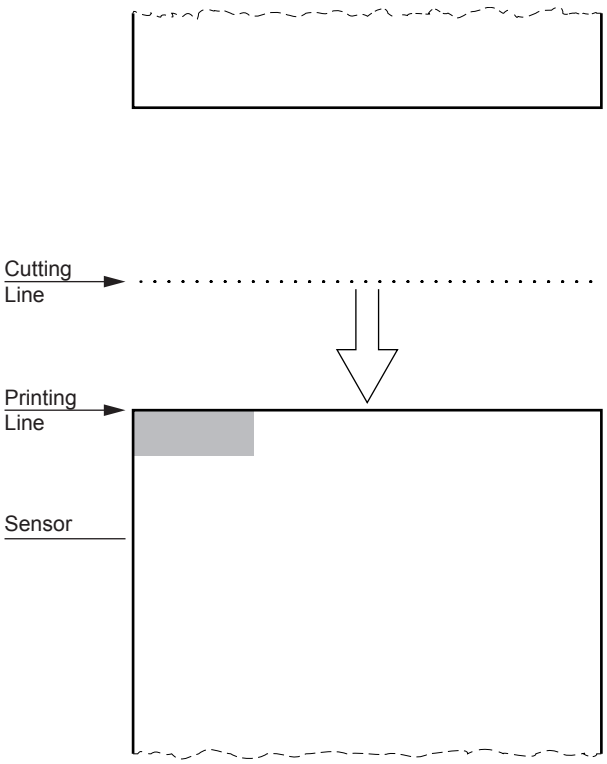
Alignment command 0x1D 0xF8.
Paper is fed. The next black mark is recognized by the sensor and aligned under the printing line.



Cut command 0x1B 0x69.
Paper is fed until the black mark is not aligned under the cutting line.

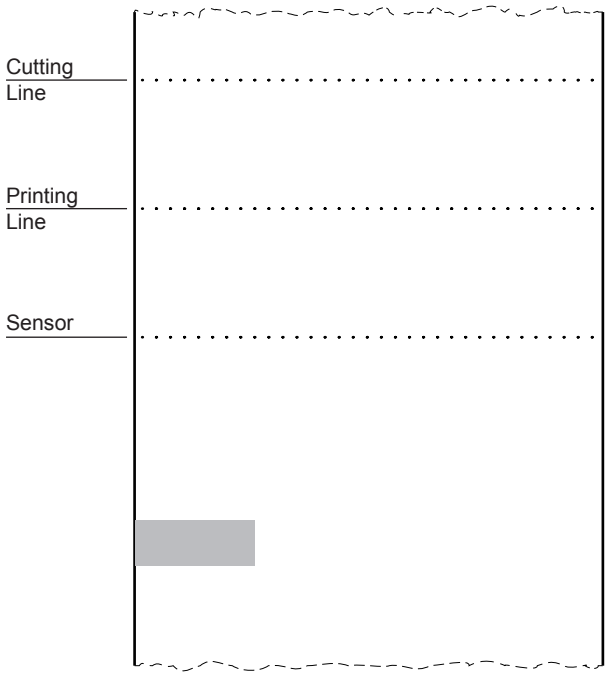


The paper is cut.
The paper is automatically retracted under the printing line.

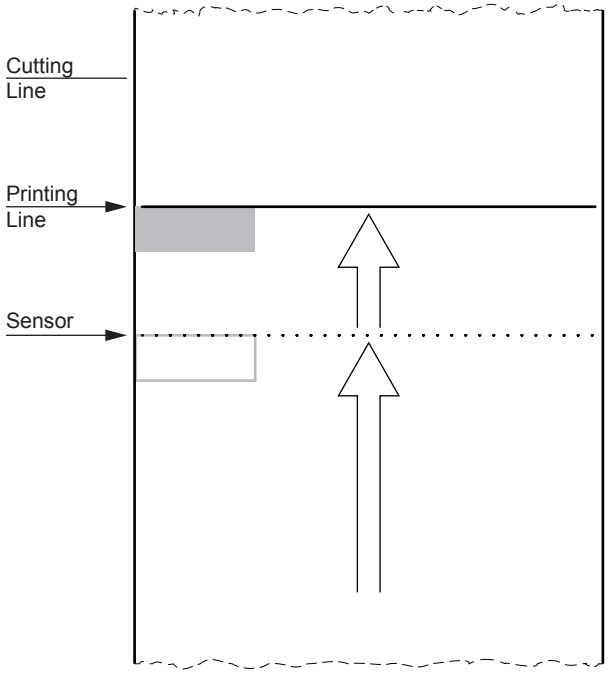


[Example 2] Commands sequence to print tickets with “alignment point” set to the edge of the notch (“Cut Distance” parameter = 0 mm set in the setup procedure) and and no paper recovery (0x1C 0xC1 0x00).

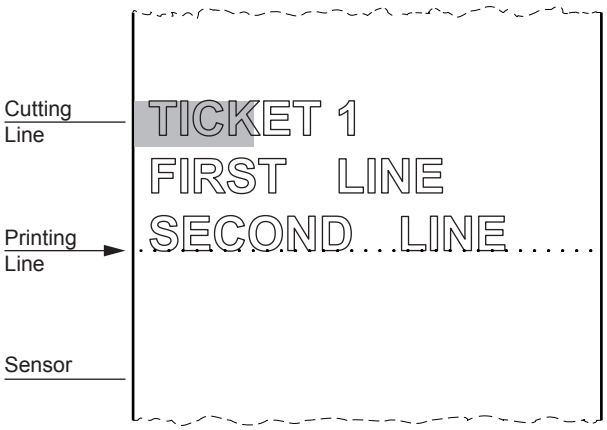
Start
Paper with black mark not aligned.



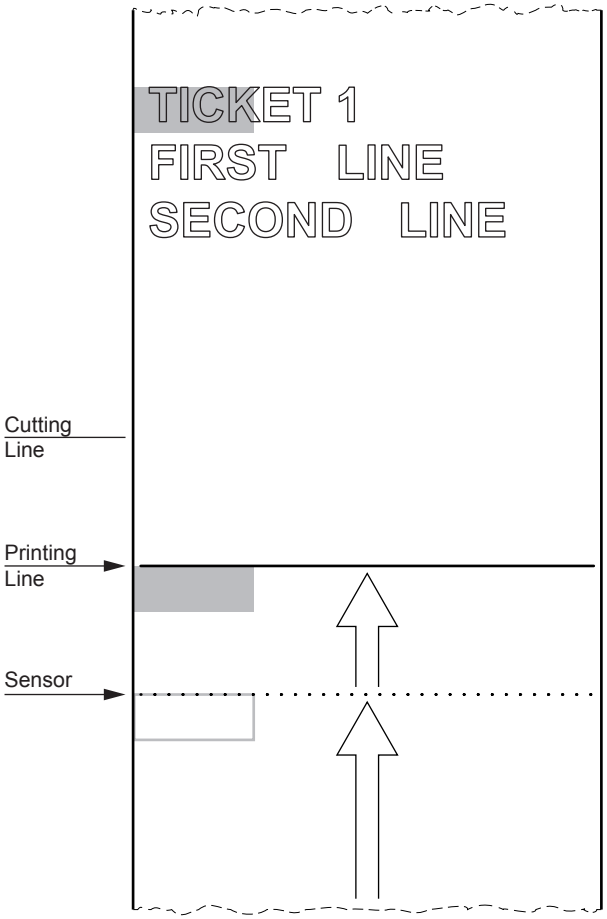
Alignment command 0x1D 0xF6.
Paper is fed. The black mark is recognized by the sensor and aligned under the printing line.



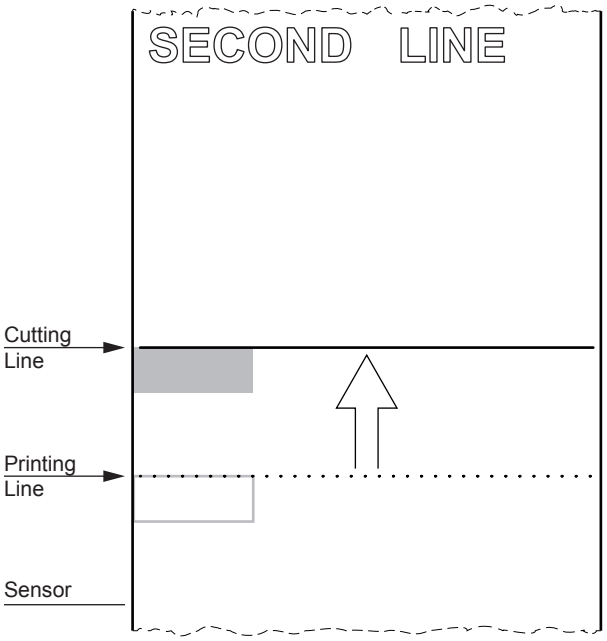
Command for text printing:
'TICKET 1', 0x0A, 'FIRST LINE', 0x0A, 'SECOND LINE', 0x0A



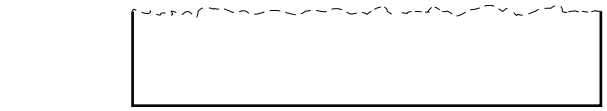
Alignment command 0x1D 0xF8.
Paper is fed. The next black mark is recognized by the sensor and aligned under the printing line.

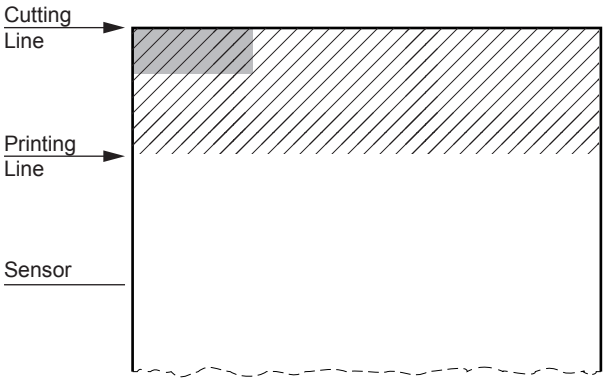


Cut command 0x1B 0x69.
Paper is fed until the black mark is not aligned under the cutting line.



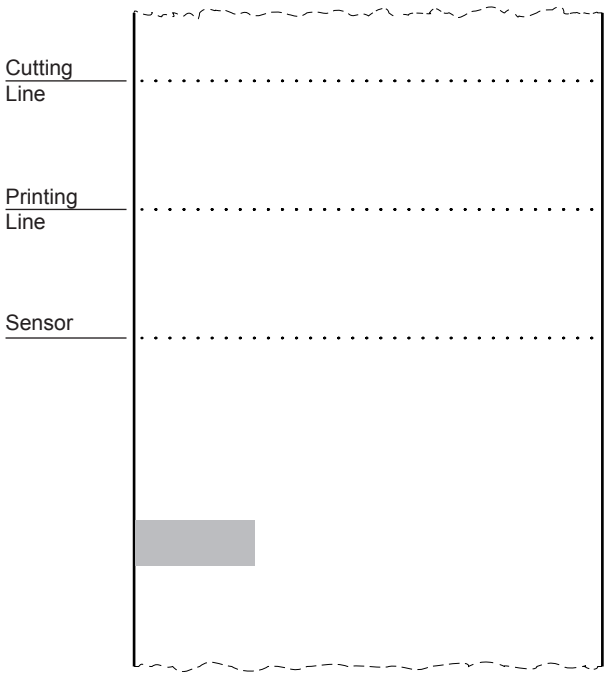
The paper is cut.
The portion of the paper between the cutting line and the printing line is not recovered.



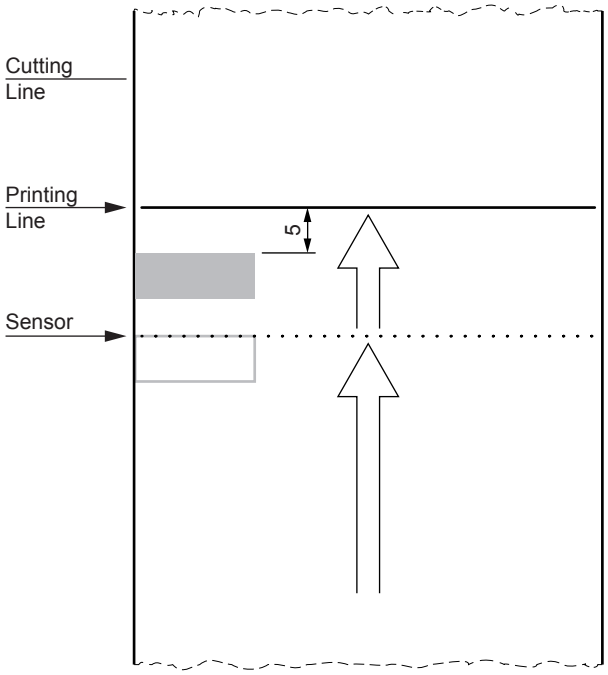


[Example 3] Commands sequence to print tickets with “alignment point” moved 5 mm compared to the edge of the black mark (“Cut Distance” = 5 mm set from setup) and with full paper recovery (0x1C 0xC1 0x16).

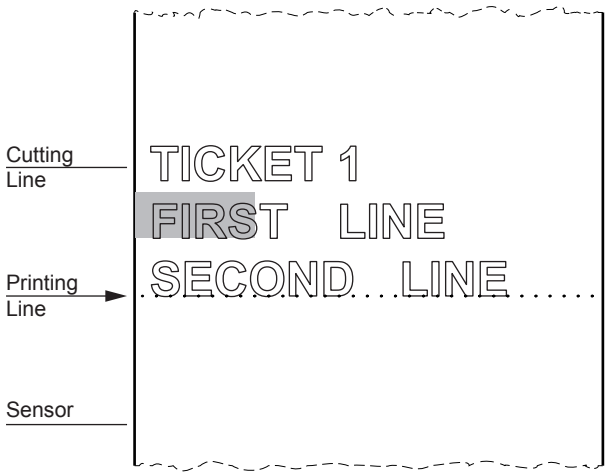
Start
Paper with black mark not aligned.



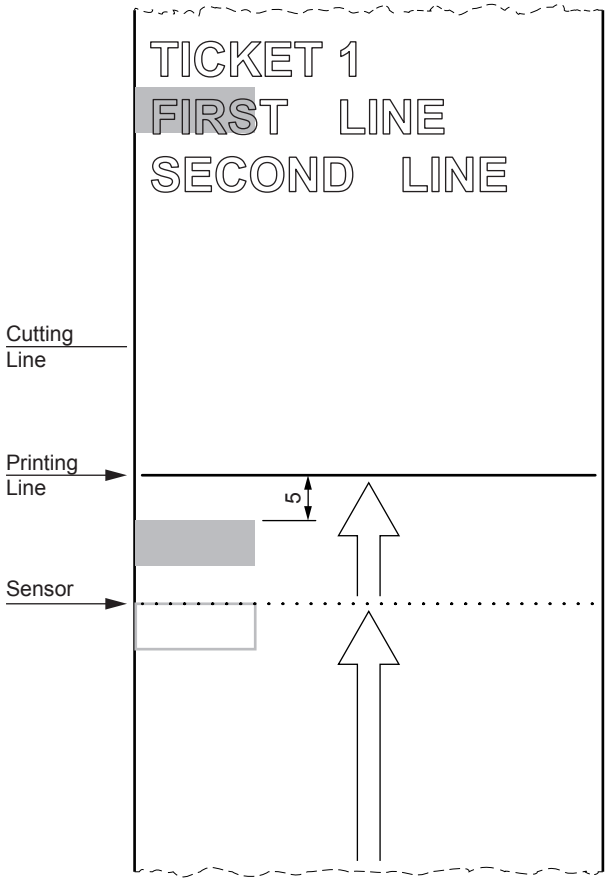
Alignment command 0x1D 0xF6.
Paper is fed. The black mark is recognized by the sensor and aligned at a distance of 5 mm (“Cut Distance”) from the printing line.



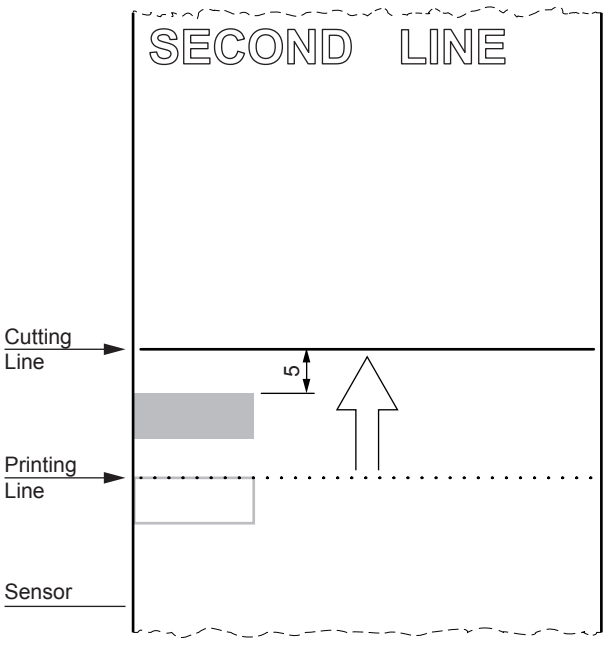
Command for text printing:
'TICKET 1', 0x0A, 'FIRST LINE', 0x0A, 'SECOND LINE', 0x0A



Alignment command 0x1D 0xF8.
Paper is fed. The next black mark is recognized by the sensor and aligned at a distance of 5 mm ("Cut Distance") from the printing line.



Cut command 0x1B 0x69.
Paper is fed until the black mark is not aligned at a distance of 5 mm (“Cut Distance”) from the cutting line.



The paper is cut.
The paper is automatically retracted under the printing.
